

GENERAL DESCRIPTION

The ML9044A used in combination with an 8-bit or 4-bit microcontroller controls the operation of a character type dot matrix LCD.

FEATURES

- Easy interfacing with 8-bit or 4-bit microcontroller
- Switchable between serial and parallel interfaces
- Dot-matrix LCD controller/driver for a small (5 × 7 dots) or large (5 × 10 dots) font
- Built-in circuit allowing automatic resetting at power-on
- Built-in 17 common signal drivers and 120 segment signal drivers
- Built-in character generation ROM capable of generating 160 small characters (5 × 7 dots) or 32 large characters (5 × 10 dots)
- Creation of character patterns by programming: up to 8 small character patterns (5 × 8 dots) or up to 4 large character patterns (5 × 11 dots)
- Built-in RC oscillation circuit using external or internal resistors
- Program-selectable duties: 1/9 duty (1 line: 5 × 7 dots + cursor + arbitrator), 1/12 duty (1 line: 5 × 10 dots + cursor + arbitrator), or 1/17 duty (2 lines: 5 × 7 dots + cursor + arbitrator)
- Built-in bias dividing resistors to drive the LCD
- Bi-directional transfer of segment outputs
- Bi-directional transfer of common outputs
- 120-dot arbitrator display
- Line display shifting
- Built-in contrast control circuit
- Built-in voltage multiplier circuit
- Gold Bump Chip

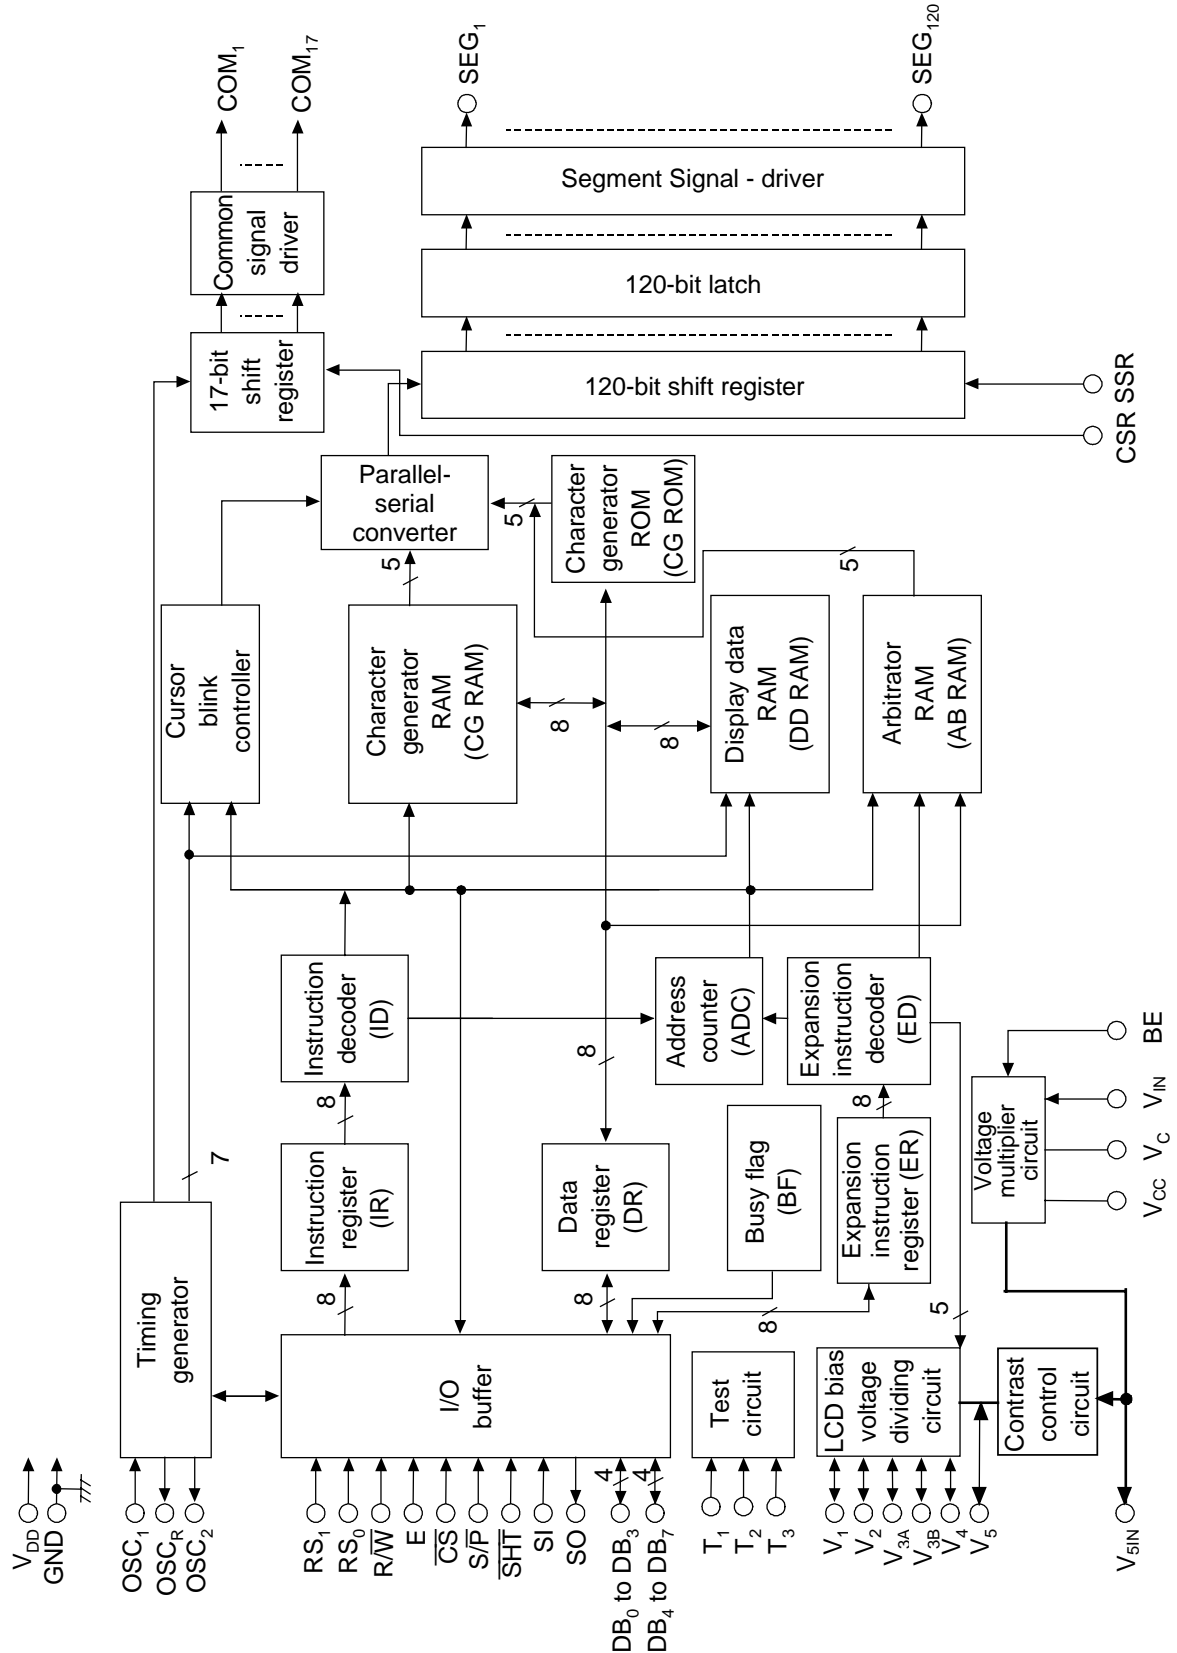

With dummy bumps on both sides of the chip: ML9044A-xxA CVWA

Without dummy bumps on both sides of the chip: ML9044A-xxB CVWA

*xx indicates a character generator ROM code number.

*51A and 51B indicate general character generator ROM code numbers.

BLOCK DIAGRAM

I/O CIRCUITS

Applied to pins SSR, CSR, S/P, and BE

Applied to pins T₁, T₂, and T₃

Applied to pins R \overline{W} , RS₁, and RS₀

Applied to pin E

At serial I/F : "0"
At parallel I/F : "1"

Applied to pin SI

At serial I/F : "1" ($\overline{CS} = "0"$)
: "0" ($\overline{CS} = "1"$)
At parallel I/F : "0"

Applied to pin \overline{SHT}

At serial I/F : "1" ($\overline{CS} = "1"$)
: "0" ($\overline{CS} = "0"$)
At parallel I/F : "1"

Applied to pin \overline{CS}

At serial I/F : "0"
At parallel I/F : "1"

Applied to pins DB₀ to DB₇

Applied to pin SO

PIN DESCRIPTIONS

| Symbol | Description | | | | | | | | | | | | |
|-------------------------------|---|--------------------------------|--------|------------------|---|---|---------------|---|---|----------------------|---|---|--------------------------------|
| $\overline{R/W}$ | The input pin with a pull-up resistor to select Read ("H") or Write ("L") in the Parallel I/F Mode. This pin should be open in the Serial I/F Mode. | | | | | | | | | | | | |
| RS_0, RS_1 | The input pins with a pull-up resistor to select a register in the Parallel I/F Mode. <table border="1" style="margin: 10px auto;"> <thead> <tr> <th>RS_1</th> <th>RS_0</th> <th>Name of register</th> </tr> </thead> <tbody> <tr> <td>H</td> <td>H</td> <td>Data register</td> </tr> <tr> <td>H</td> <td>L</td> <td>Instruction register</td> </tr> <tr> <td>L</td> <td>L</td> <td>Expansion Instruction register</td> </tr> </tbody> </table> This pin should be open in the Serial I/F Mode. | RS_1 | RS_0 | Name of register | H | H | Data register | H | L | Instruction register | L | L | Expansion Instruction register |
| RS_1 | RS_0 | Name of register | | | | | | | | | | | |
| H | H | Data register | | | | | | | | | | | |
| H | L | Instruction register | | | | | | | | | | | |
| L | L | Expansion Instruction register | | | | | | | | | | | |
| E | The input pin for data input/output between the CPU and the ML9044A and for activating instructions in the Parallel I/F Mode. This pin should be open in the Serial I/F Mode. | | | | | | | | | | | | |
| DB_0 to DB_3 | The input/output pins to transfer data of lower-order 4 bits between the CPU and the ML9044A in the Parallel I/F Mode. The pins are not used for the 4-bit interface and serial interface. Each pin is equipped with a pull-up resistor, so this pin should be open when not used. | | | | | | | | | | | | |
| DB_4 to DB_7 | The input/output pins to transfer data of upper 4 bits between the CPU and the ML9044A in the Parallel I/F Mode. The pins are not used for the serial interface. Each pin is equipped with a pull-up resistor, so this pin should be open in the Serial I/F Mode when not used. | | | | | | | | | | | | |
| OSC_1 OSC_2 OSC_R | The clock oscillation pins required for LCD drive signals and the operation of the ML9044A by instructions sent from the CPU. To input external clock, the OSC_1 pin should be used. The OSC_R and the OSC_2 pins should be open. To start oscillation with an external resistor, the resistor should be connected between the OSC_1 and OSC_2 pins. The OSC_R pin should be open. To start oscillation with an internal resistor, the OSC_2 and OSC_R pins should be short-circuited outside the ML9044A. The OSC_1 pin should be open. | | | | | | | | | | | | |
| COM_1 to COM_{17} | The LCD common signal output pins. For 1/9 duty, non-selectable voltage waveforms are output via COM_{10} to COM_{17} . For 1/12 duty, non-selectable voltage waveforms are output via COM_{13} to COM_{17} . | | | | | | | | | | | | |
| SEG_1 to SEG_{120} | The LCD segment signal output pins. | | | | | | | | | | | | |

| Symbol | Description |
|--|---|
| CSR | The input pin to select the transfer direction of the common signal output data. At 1/n duty, data is transferred from COM1 to COMn when "L" is applied to this pin and transferred from COMn to COM1 when "H" is applied to this pin. |
| SSR | The input pin to select the transfer direction of the segment signal output data. "L": Data transfer from SEG ₁ to SEG ₁₂₀ "H": Data transfer from SEG ₁₂₀ to SEG ₁ |
| V ₁ , V ₂ , V _{3A} , V _{3B} , V ₄ | The pins to output bias voltages to the LCD. For 1/4 bias : The V ₂ and V _{3B} pins are shorted. For 1/5 bias : The V _{3A} and V _{3B} pins are shorted. |
| BE | The input pin to enable or disable the voltage multiplier circuit. "L" disables the voltage multiplier circuit. "H" enables the voltage multiplier circuit. The voltage multiplier circuit doubles the input voltage between V _{DD} and V _{IN} and the multiplied voltage referenced to V _{DD} is output to the V _{5IN} pin. The voltage multiplier circuit can be used only when generating a level lower than GND. |
| V _{IN} | The pin to input voltage to the voltage multiplier. |
| V ₅ , V _{5IN} | The pins to supply the LCD drive voltage. The LCD drive voltage is supplied to the V ₅ pin when the voltage multiplier is not used (BE = "0") and the internal contrast adjusting circuit is also not used. At this time, the V _{5IN} pin should be open. The LCD drive voltage is supplied to the V _{5IN} pin when the voltage multiplier is not used (BE = "0") but the internal contrast adjusting circuit is used. At this time, the V ₅ pin should be open. When the voltage multiplier is used (BE = "1"), the V ₅ pin should be open (the multiplied voltage is output to the V _{5IN} pin). In this case, the internal contrast adjusting circuit must be used. Capacitors for the voltage multiplier should be connected between the V _{DD} pin and the V _{5IN} pin. |
| V _C | The pin to connect the positive pin of the capacitor for the voltage multiplier. Leave the pin open when the voltage multiplier circuit is not used. |
| V _{CC} | The pin to connect the negative pin of the capacitor used for the voltage multiplier. Leave the pin open when the voltage multiplier circuit is not used. |

| Symbol | Description |
|------------------|---|
| T_1, T_2, T_3 | The input pins for test circuits (normally open). Each of these pins is equipped with a pull-down resistor, so this pin should be left open. |
| V_{DD} | The power supply pin. |
| GND | The ground level input pin. |
| S/\bar{P} | The input pin to select the serial or parallel interface. “L” selects the parallel interface. “H” selects the serial interface. |
| \overline{CS} | The pin to enable this IC in the serial I/F mode. “L” enables this IC. “H” disables this IC. This pin should be open in the parallel I/F mode. |
| \overline{SHT} | The pin to input shift clock in the serial I/F mode. Data inputting to the SI pin is carried out synchronizing with the rising edge of this clock signal. Data outputting from the SO pin is carried out synchronizing with the falling edge of this clock signal. This pin should be open in the parallel I/F mode. |
| SI | The pin to input DATA in the serial I/F mode. Data inputting to this pin is carried out synchronizing with the rising edge of the \overline{SHT} signal. This pin should be open in the parallel I/F mode. |
| SO | The pin to output DATA in the serial I/F mode. Data inputting to this pin is carried out synchronizing with the falling edge of the \overline{SHT} signal. This pin should be open in the parallel I/F mode. |
| DUMMY | NC pin. Leave this pin open. |

ABSOLUTE MAXIMUM RATINGS

(GND = 0 V)

| Parameter | Symbol | Condition | Rating | Unit | Applicable pins |
|---------------------|---------------------------|-----------|------------------------------|------|--|
| Supply Voltage | V_{DD} | Ta = 25°C | -0.3 to +6.5 | V | V_{DD} -GND |
| LCD Driving Voltage | V_1, V_2, V_3, V_4, V_5 | Ta = 25°C | $V_{DD}-7.5$ to $V_{DD}+0.3$ | V | $V_1, V_4, V_5, V_{5IN}, V_2, V_{3A}, V_{3B}$ |
| Input Voltage | V_I | Ta = 25°C | -0.3 to $V_{DD}+0.3$ | V | $R/\bar{W}, E, \bar{SHT}, CSR, S/\bar{P}, SSR, SI, RS_0, RS_1, BE, \bar{CS}, T_1$ to T_3, DB_0 to DB_7, V_{IN} |
| Storage Temperature | T_{STG} | — | -55 to +150 | °C | — |

RECOMMENDED OPERATING CONDITIONS

(GND = 0 V)

| Parameter | Symbol | Condition | Range | Unit | Applicable pins |
|---|----------------------------|-----------|------------|------|-------------------------------|
| Supply Voltage | V_{DD} | — | 2.7 to 5.5 | V | V_{DD} -GND |
| LCD Driving Voltage | $V_{DD}-V_5$ (See Note) | — | 3.3 to 7.0 | V | $V_{DD}-V_5$ (V_{5IN}) |
| Voltage Multiplier Operating Voltage | V_{MUL} | BE = "1" | 2.7 to 3.5 | V | $V_{DD}-V_{IN}$ |
| Operating Temperature | T_{op} | — | -40 to +85 | °C | — |

Note: This voltage should be applied across V_{DD} and V_5 . The following voltages are output to the V_1, V_2, V_{3A} (V_{3B}) and V_4 pins:

- 1/4 bias

$$V_1 = \{V_{DD} - (V_{DD} - V_5)/4\} \pm 0.15 \text{ V}$$

$$V_2 = V_{3B} = \{V_{DD} - (V_{DD} - V_5)/2\} \pm 0.15 \text{ V}$$

$$V_4 = \{V_{DD} - 3 \times (V_{DD} - V_5)/4\} \pm 0.15 \text{ V}$$

- 1/5 bias

$$V_1 = \{V_{DD} - (V_{DD} - V_5)/5\} \pm 0.15 \text{ V}$$

$$V_2 = \{V_{DD} - 2 \times (V_{DD} - V_5)/5\} \pm 0.15 \text{ V}$$

$$V_{3A} = V_{3B} = \{V_{DD} - 3 \times (V_{DD} - V_5)/5\} \pm 0.15 \text{ V}$$

$$V_4 = \{V_{DD} - 4 \times (V_{DD} - V_5)/5\} \pm 0.15 \text{ V}$$

The voltages at the V_1, V_2, V_{3A} (V_{3B}), V_4 and V_5 pins should satisfy

$$V_{DD} > V_1 > V_2 > V_{3A} \text{ (} V_{3B} \text{)} > V_4 > V_5.$$

(Higher ← → Lower)

* If the chip is attached on a substrate using COG technology, the chip tends to be susceptible to electrical characteristics of the chip due to trace resistance on the glass substrate. It is recommended to use the chip by confirming that it operates on the glass substrate properly. Trace resistance, especially, V_{DD} and V_{SS} trace resistance, between the chip on the LCD panel and the flexible cable should be designed as low as possible. Trace resistance that cannot be very well decreased, larger size of the LCD panel, or greater trace capacitance between the microcontroller and the ML9044A device can cause device malfunction. In order to avoid the device malfunction, power noise should be reduced by serial interfacing of the microcontroller and the ML9044A device.

* Do not apply short-circuiting across output pins and across an output pin and an input/output pin or the power supply pin in the output mode.

ELECTRICAL CHARACTERISTICS

DC Characteristics

(GND = 0 V, $V_{DD} = 2.7$ to 5.5 V, $T_a = -40$ to $+85^\circ\text{C}$)

| Parameter | Symbol | Condition | Min. | Typ. | Max. | Unit | Applicable pin | |

| | | V _{DD} = 3.9 V, V _{5IN} = 0 V, 1/4 bias, Contrast data: 00, No load | | 1.9 | — | 2.5 | | |
| Bias Voltage for Driving LCD | V _{LCD1} | V _{DD} -V ₅ Note 9 | 1/5 bias | 3.3 | — | 7.0 | V | V ₅ |
| | V _{LCD2} | | 1/4 bias | 3.3 | — | 7.0 | | |

Note 1: Applied to the voltage drop occurring between any of the V_{DD}, V₁, V₄ and V₅ pins and any of the common pins (COM₁ to COM₁₇) when the current of 4 μA flows in or flows out at one common pin.

Also applied to the voltage drop occurring between any of the V_{DD}, V₂, V_{3A} (V_{3B}) and V₅ pins and any of the segment pins (SEG₁ to SEG₁₂₀) when the current of 4 μA flows in or flows out at one common pin.

The current of 4 μA flows out when the output level is V_{DD} or flows in when the output level is V₅.

Note 2: Applied to the current flowing into the V_{DD} pin when the external clock (f_{OSC2} = f_{in} = 270 kHz) is fed to the internal R_f oscillation or OSC₁ under the following conditions:

V_{DD} = 5 V
 GND = V₅ = 0 V,
 V₁, V₂, V_{3A} (V_{3B}) and V₄: Open
 E, SSR, CSR, and BE: "L" (fixed)
 Other input pins: "L" or "H" (fixed)
 Other output pins: No load

Note 3:

Note 4:

The wire between OSC₁ and R_f and the wire between OSC₂ and R_f should be as short as possible. Keep OSC_R open.

The wire between OSC₂ and OSC_R should be as short as possible. Keep OSC₁ open.

Note 5:

Note 6:

Note 7: The maximum value of the voltage multiplier input voltage should be set at 3.5 V, and the minimum value of the voltage multiplier input voltage should be set so that the voltage multiplier output voltage meets the specification for the bias voltage for driving LCD after contrast adjustment.

Note 8: If using the built-in contrast control circuit, control the circuit so that the voltage of V_{DD}-V₅ is the minimum value of the bias voltage for driving LCD or higher.

Note 9: For 1/4 bias, V₂ and V_{3B} pins are short-circuited. V_{3A} pin is open. For 1/5 bias, V_{3A} and V_{3B} pins are short-circuited. V₂ pin is open.

Switching Characteristics (The following ratings are subject to change after ES evaluation.)

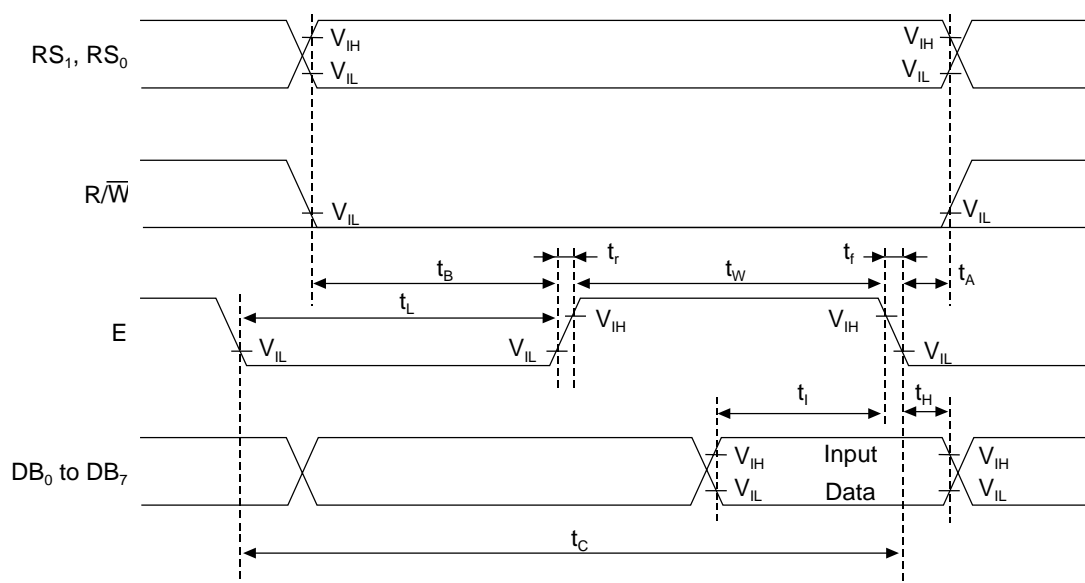

- Parallel Interface Mode

The timing for the input from the CPU (see 1) and the timing for the output to the CPU (see 2) are as shown below:

1) WRITE MODE (Timing for input from the CPU)

($V_{DD} = 2.7$ to 5.5 V, $T_a = -40$ to $+85^\circ\text{C}$)

| Parameter | Symbol | Min. | Typ. | Max. | Unit |
|---|--------|------|------|------|------|
| R/\overline{W} , RS_0 , RS_1 Setup Time | t_B | 40 | — | — | ns |
| E Pulse Width | t_W | 450 | — | — | ns |
| R/\overline{W} , RS_0 , RS_1 Hold Time | t_A | 10 | — | — | ns |
| E Rise Time | t_r | — | — | 25 | ns |
| E Fall Time | t_f | — | — | 25 | ns |
| E Pulse Width | t_L | 430 | — | — | ns |
| E Cycle Time | t_C | 1000 | — | — | ns |
| DB_0 to DB_7 Input Data Hold Time | t_I | 195 | — | — | ns |
| DB_0 to DB_7 Input Data Setup Time | t_H | 10 | — | — | ns |

2) READ MODE (Timing for output to the CPU)

($V_{DD} = 2.7$ to 5.5 V, $T_a = -40$ to $+85^\circ\text{C}$)

| Parameter | Symbol | Min. | Typ. | Max. | Unit |
|---|----------------|------|------|------|------|
| R/W, RS ₁ , RS ₀ Setup Time | t _B | 40 | — | — | ns |
| E Pulse Width | t _W | 450 | — | — | ns |
| R/W, RS ₁ , RS ₀ Hold Time | t _A | 10 | — | — | ns |
| E Rise Time | t _r | — | — | 25 | ns |
| E Fall Time | t _f | — | — | 25 | ns |
| E Pulse Width | t _L | 430 | — | — | ns |
| E Cycle Time | t _C | 1000 | — | — | ns |
| DB ₀ to DB ₇ Output Data Delay Time | t _D | — | — | 350 | ns |
| DB ₀ to DB ₇ Output Data Hold Time | t _O | 20 | — | — | ns |

Note: A load capacitance of each of DB₀ to DB₇ must be 50 pF or less.

• Serial Interface Mode

($V_{DD} = 2.7$ to 5.5 V, $T_a = -40$ to $+85^\circ\text{C}$)

| Parameter | Symbol | Min. | Typ. | Max. | Unit |
|---|-------------------|------|------|------|------|
| $\overline{\text{SHT}}$ Cycle Time | t_{SCY} | 500 | — | — | ns |
| $\overline{\text{CS}}$ Setup Time | t_{CSU} | 100 | — | — | ns |
| $\overline{\text{CS}}$ Hold Time | t_{CH} | 100 | — | — | ns |
| $\overline{\text{CS}}$ "H" Pulse Width | t_{CSWH} | 200 | — | — | ns |
| $\overline{\text{SHT}}$ Setup Time | t_{SSU} | 60 | — | — | ns |
| $\overline{\text{SHT}}$ Hold Time | t_{SH} | 200 | — | — | ns |
| $\overline{\text{SHT}}$ "H" Pulse Width | t_{SWH} | 200 | — | — | ns |
| $\overline{\text{SHT}}$ "L" Pulse Width | t_{SWL} | 200 | — | — | ns |
| $\overline{\text{SHT}}$ Rise Time | t_{SR} | — | — | 50 | ns |
| $\overline{\text{SHT}}$ Fall Time | t_{SF} | — | — | 50 | ns |
| SI Setup Time | t_{DISU} | 100 | — | — | ns |
| SI Hold Time | t_{DIH} | 100 | — | — | ns |
| Data Output Delay Time | t_{DOD} | — | — | 160 | ns |
| Data Output Hold Time | t_{CDH} | 0 | — | — | ns |

Address Counter (ADC)

The address counter provides a read/write address for the DDRAM, ABRAM or CGRAM and also provides a cursor display address.

When an instruction code specifying DDRAM, ABRAM or CGRAM address setting is input to the pre-defined register, the register selects the specified DDRAM, ABRAM or CGRAM and transfers the address code to the ADC. The address data in the ADC is automatically incremented (or decremented) by 1 after the display data is written in or read from the DDRAM, ABRAM or CGRAM.

The data in the ADC is output to DB₀ to DB₆ when $R\overline{W}$ = "H", RS₀ = "L", RS₁ = "H" and BF = "0".

Timing Generator

The timing generator generates timing signals for the internal operation of the ML9044A activated by the instruction sent from the CPU or for the operation of the internal circuits of the ML9044A such as DDRAM, ABRAM, CGRAM and CGROM. Timing signals are generated so that the internal operation carried out for LCD displaying will not be interfered by the internal operation initiated by accessing from the CPU. For example, when the CPU writes data in the DDRAM, the display of the LCD not corresponding to the written data is not affected.

Display Data RAM (DDRAM)

This RAM stores the 8-bit character codes (see Table 2).

The DDRAM addresses correspond to the display positions (digits) of the LCD as shown below. The DDRAM addresses (to be set in the ADC) are represented in hexadecimal.

(Example) Representation of DDRAM address = 12

1) Relationship between DDRAM addresses and display positions (1-line display mode)

In the 1-line display mode, the ML9044A can display up to 24 characters from digit 1 to digit 24. While the DDRAM has addresses “00” to “4F” for up to 80 character codes, the area not used for display can be used as a RAM area for general data. When the display is shifted by instruction, the relationship between the LCD display and the DDRAM address changes as shown below:

2) Relationship between DDRAM addresses and display positions (2-line display mode)

In the 2-line mode, the ML9044A can display up to 48 characters (24 characters per line) from digit 1 to digit 24.

| | Digit | | | | | | | | | | | | |
|--------|-------|----|----|----|----|-------|--|--|--|--|----|----|-------------------------|
| | 1 | 2 | 3 | 4 | 5 | | | | | | 23 | 24 | ← Display position |
| Line 1 | 00 | 01 | 02 | 03 | 04 | ~~~~~ | | | | | 16 | 17 | ← DD RAM |
| Line 2 | 40 | 41 | 42 | 43 | 44 | ~~~~~ | | | | | 56 | 57 | ← address (hexadecimal) |

Note: The DDRAM address at digit 24 in the first line is not consecutive to the DDRAM address at digit 1 in the second line.

When the display is shifted by instruction, the relationship between the LCD display and the DDRAM address changes as shown below:

| | Digit | | | | | | | | | | | | | |
|--------------------------------|--------|----|----|----|----|----|-------|--|--|--|----|----|----|--|
| | 1 | 2 | 3 | 4 | 5 | | | | | | 23 | 24 | | |
| (Display shifted to the right) | Line 1 | 27 | 00 | 01 | 02 | 03 | ~~~~~ | | | | | 15 | 16 | |
| | Line 2 | 67 | 40 | 41 | 42 | 43 | ~~~~~ | | | | | 55 | 56 | |

| | Digit | | | | | | | | | | | | | |
|-------------------------------|--------|----|----|----|----|----|-------|--|--|--|----|----|----|--|
| | 1 | 2 | 3 | 4 | 5 | | | | | | 23 | 24 | | |
| (Display shifted to the left) | Line 1 | 01 | 02 | 03 | 04 | 05 | ~~~~~ | | | | | 17 | 18 | |
| | Line 2 | 41 | 42 | 43 | 44 | 45 | ~~~~~ | | | | | 57 | 58 | |

Character Generator ROM (CGROM)

The CGROM generates small character patterns (5×7 dots, 160 patterns) or large character patterns (5×10 dots, 32 patterns) from the 8-bit character code signals in the DDRAM.

When the 8-bit character code corresponding to a character pattern in the CGROM is written in the DDRAM, the character pattern is displayed in the display position specified by the DDRAM address.

Character codes 20 to 7F and A0 to FF are contained in the character code area in the CG ROM.

Character codes 20 to 7F and A0 to DF are contained in the character code area for the 5×7 -dot character patterns.

Character codes E0 to FF are contained in the ROM area for 5×10 -dot character patterns.

The general character generator ROM codes are 51A/51B.

The relationship between character codes and general purpose character patterns are indicated in Table 2.

Character Generator RAM (CGRAM)

The CGRAM is used to generate user-specific character patterns that are not in the CGROM. CGRAM (64 bytes = 512 bits) can store up to 8 small character patterns (5×8 dots) or up to 4 large character patterns (5×11 dots). When displaying a character pattern stored in the CGRAM, write an 8-bit character code (00 to 07 or 08 to 0F; hex.) assigned in Table 2 to the DDRAM. This enables outputting the character pattern to the LCD display position corresponding to the DDRAM address.

The cursor or blink is also displayed even when a CGRAM or ABRAM address is set in the ADC. Therefore, the cursor or blink display should be inhibited while the ADC is holding a CGRAM or ABRAM address.

The following describes how character patterns are written in and read from the CGRAM.

1) Small character patterns (5×8 dots) (See Table 3-1.)

(1) A method of writing character patterns to the CGRAM from the CPU

The three CGRAM address bit weights 0 to 2 select one of the lines constituting a character pattern.

First, set the mode to increment or decrement from the CPU, and then input the CGRAM address.

Write each line of the character pattern in the CGRAM through DB_0 to DB_7 .

The data lines DB_0 to DB_7 correspond to the CGRAM data bit weights 0 to 7, respectively (see Table 3-1). Input data "1" represents the ON status of an LCD dot and "0" represents the OFF status. Since the ADC is automatically incremented or decremented by 1 after the data is written to the CGRAM, it is not necessary to set the CGRAM address again.

The bottom line of a character pattern (the CGRAM address bit weights 0 to 2 are all "1", which means 7 in hexadecimal) is the cursor line. The ON/OFF pattern of this line is ORed with the cursor pattern for displaying on the LCD. Therefore, the pattern data for the cursor position should be all zeros to display the cursor.

Whereas the data given by the CGRAM data bit weights 0 to 4 is output to the LCD as display data, the data given by the CGRAM data bit weights 5 to 7 is not. Therefore, the CGRAM data bit weights 5 to 7 can be used as a RAM area.

(2) A method of displaying CGRAM character patterns on the LCD

The CGRAM is selected when the higher-order 4 bits of a character code are all zeros. Since bit weight 3 of a character code is not used, the character pattern "0" in Table 3-1 can be selected using the character code "00" or "08" in hexadecimal.

When the 8-bit character code corresponding to a character pattern in the CGRAM is written to the DDRAM, the character pattern is displayed in the display position specified by the DDRAM address. (The DDRAM data bit weights 0 to 2 correspond to the CGRAM address bit weights 3 to 5, respectively.)

2) Large character patterns (5×11 dots) (See Table 3-2.)

(1) A method of writing character patterns to the CGRAM from the CPU

The four CGRAM address bit weights 0 to 3 select one of the lines constituting a character pattern.

First, set the mode to increment or decrement from the CPU, and then input the CGRAM address.

Write each line of the character pattern code in the CGRAM through DB_0 to DB_7 .

The data lines DB_0 to DB_7 correspond to the CGRAM data bit weights 0 to 7, respectively (see Table 3-2). Input data "1" represents the ON status of an LCD dot and "0" represents the OFF status. Since the ADC is automatically incremented or decremented by 1 after the data is written to the CGRAM, it is not necessary to set the CGRAM address again.

The bottom line of a character pattern (the CGRAM address bit weights 0 to 3 are all "1", which means A in hexadecimal) is a cursor line. The ON/OFF pattern of this line is ORed with the cursor pattern for displaying on the LCD. Therefore, the pattern data for the cursor position should be all zeros to display the cursor.

Whereas CGRAM data bit weights 0 to 4 are output as display data to the LCD when CGRAM address bit weights 0 to 3 are "0" to "A" in hexadecimal, the data given by the CGRAM data bit weights 5 to 7 or the CGRAM addresses B to F in hexadecimal is not. These bits can be written and read as a RAM area.

(2) A method of displaying CGRAM character patterns on the LCD

The CGRAM is selected when the higher-order 4 bits of a character code are all zeros. Since bit weights 0 and 3 of a character code are not used, the character pattern "g" in Table 3-2 can be selected with a character code "02", "03", "0A" or "0B" in hexadecimal.

When the 8-bit character code corresponding to a character pattern in the CGRAM is written to the DDRAM, the character pattern is displayed in the display position specified by the DDRAM address. (The DDRAM data bit weights 1 and 2 correspond to the CGRAM address bit weights 4 and 5, respectively.)

Arbitrator RAM (ABRAM)

The arbitrator RAM (ABRAM) stores arbitrator display data.

120 dots can be displayed in both 1-line and 2-line display modes. The arbitrator RAM has the addresses (hexadecimal) from “00” to “1F” and the valid display address area is from 00 to 23 (0H to 17H). The area of 24 to 31 (18H to 1FH) not used for display can be used as a data RAM area for general data. Even if the display is shifted by instruction, the arbitrator display is not shifted.

A capacity of 8 bits by 32 addresses (= 256 bits) is available for data write.

First set the mode to increment or decrement from the CPU, and then input the ABRAM address.

Write Display-ON data in the ABRAM through DB₀ to DB₇.

DB₀ to DB₇ correspond to the ABRAM data bit weights 0 to 7 respectively. Input data “1” represents the ON status of an LCD dot and “0” represents the OFF status.

Since ADC is automatically incremented or decremented by 1 after the data is written to the ABRAM, it is not necessary to set the ABRAM address again.

Whereas ABRAM data bit weights 0 to 4 are output as display data to the LCD, the ABRAM data bit weights 5 to 7 are not. These bits can be used as a RAM area.

The cursor or blink is also displayed even when a CGRAM or ABRAM address is set in the ADC. Therefore, the cursor or blink display should be inhibited while the ADC is holding a CGRAM or ABRAM address.

The arbitrator RAM can store a maximum of 120 dots of the arbitrator Display-ON data in units of 5 dots. The relationship with the LCD display positions is shown below.

Table 2 Relationship between Character Codes and Character Patterns of the ML9044A-51A/51B (General Character Codes)

The character code area in the CG ROM: Character codes 20H to 7FH, A0H to FFH.

5×7-dot ROM area: 20H to 7FH, A0H to DFH

5×10-dot ROM area: E0H to FFH

Cursor/Blink Control Circuit

This circuit generates the cursor and blink of the LCD.

The operation of this circuit is controlled by the program of the CPU.

The cursor/blink display is carried out in the position corresponding to the DDRAM address set in the ADC (Address Counter).

For example, when the ADC stores a value of “07” (hexadecimal), the cursor or blink is displayed as follows:

Note: The cursor or blink is also displayed even when a CGRAM or ABRAM address is set in the ADC. Therefore, the cursor or blink display should be inhibited while the ADC is holding a CGRAM or ABRAM address.

LCD Display Circuit (COM1 to COM17, SEG1 to SEG120, SSR and CSR)

The ML9044A has 17 common signal outputs and 120 segment signal outputs to display 24 characters (in the 1-line display mode) or 48 characters (in the 2-line display mode).

The character pattern is converted into serial data and transferred in series through the shift register.

The transfer direction of serial data is determined by the SSR pin. The shift direction of common signals is determined by the CSR pin. The following tables show the transfer and shift directions:

| | | | | |
|-----|---------------------------------------|--------|-----------------|-------------------------|
| SSR | Transfer direction | | | |
| L | SEG ₁ → SEG ₁₂₀ | | | |
| H | SEG ₁₂₀ → SEG ₁ | | | |
| CSR | duty | AS bit | Shift Direction | Arbitrator's common pin |
| L | 1/9 | L | COM1 → COM9 | COM9 |
| L | 1/9 | H | COM1 → COM9 | COM1 |
| L | 1/12 | L | COM1 → COM12 | COM12 |
| L | 1/12 | H | COM1 → COM12 | COM1 |
| L | 1/17 | L | COM1 → COM17 | COM17 |
| L | 1/17 | H | COM1 → COM17 | COM1 |
| H | 1/9 | L | COM9 → COM1 | COM1 |
| H | 1/9 | H | COM9 → COM1 | COM9 |
| H | 1/12 | L | COM12 → COM1 | COM1 |
| H | 1/12 | H | COM12 → COM1 | COM12 |
| H | 1/17 | L | COM17 → COM1 | COM1 |
| H | 1/17 | H | COM17 → COM1 | COM17 |

* Refer to the Expansion Instruction Codes section about the AS bit.

Signals to be input to the SSR and CSR pins should be determined at power-on and be kept unchanged.

Built-in Reset Circuit

The ML9044A is automatically initialized when the power is turned on.

During initialization, the Busy Flag (BF) is "1" and the ML9044A does not accept any instruction from the CPU (other than the Read BF instruction).

The Busy Flag is "1" for about 15 ms after the V_{DD} becomes 2.7 V or higher.

During this initialization, the ML9044A performs the following instructions:

- 1) Display clearing
- 2) CPU interface data length = 8 bits (DL = "1")
- 3) 1-line LCD display (N = "0")
- 4) Font size = 5×7 dots (F = "0")
- 5) ADC counting = Increment (I/D = "1")
- 6) Display shifting = None (S = "0")
- 7) Display = Off (D = "0")
- 8) Cursor = Off (C = "0")
- 9) Blinking = Off (B = "0")
- 10) Arbitrator = Displayed in the lower line (AS = "0")
- 11) Setting 1FH (hexadecimal) to the Contrast Data

To use the built-in reset circuit, the power supply conditions shown below should be satisfied. Otherwise, the built-in reset circuit may not work properly. In such a case, initialize the ML9044A with the instructions from the CPU. The use of a battery always requires such initialization from the CPU. (See "Initial Setting of Instructions")

Figure 1 Power-on and Power-off Waveform

I/F with CPU

Parallel interface mode

The ML9044A can transfer either 8 bits once or 4 bits twice on the data bus for interfacing with any 8-bit or 4-bit microcontroller (CPU).

1) 8-bit interface data length

The ML9044A uses all of the 8 data bus lines DB₀ to DB₇ at a time to transfer data to and from the CPU.

2) 4-bit interface data length

The ML9044A uses only the higher-order 4 data bus lines DB₄ to DB₇ twice to transfer 8-bit data to and from the CPU.

The ML9044A first transfers the higher-order 4 bits of 8-bit data (DB₄ to DB₇ in the case of 8-bit interface data length) and then the lower-order 4 bits of the data (DB₀ to DB₃ in the case of 8-bit interface data length).

The lower-order 4 bits of data should always be transferred even when only the transfer of the higher-order 4 bits of data is required. (Example: Reading the Busy Flag)

Two transfers of 4 bits of data complete the transfer of a set of 8-bit data. Therefore, when only one access is made, the following data transfer cannot be completed properly.

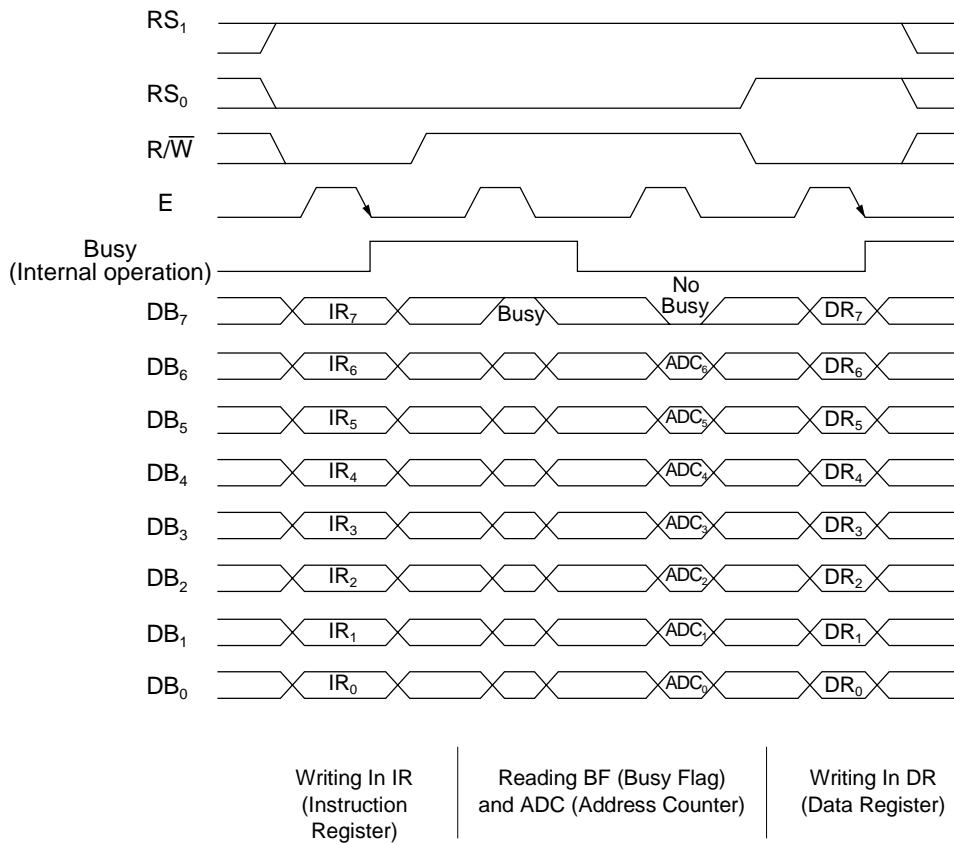

Figure 2 8-Bit Data Transfer

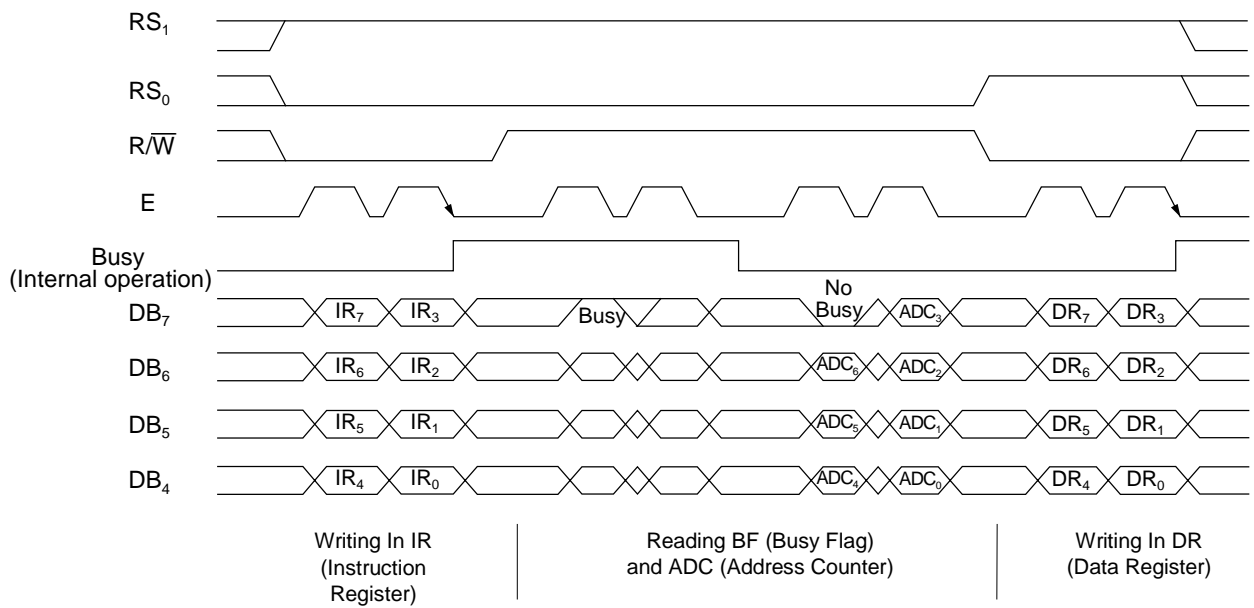

Figure 3 4-Bit Data Transfer

Serial Interface Mode

In the Serial I/F Mode, the ML9044A interfaces with the CPU via the \overline{CS} , \overline{SHT} , SI and SO pins.

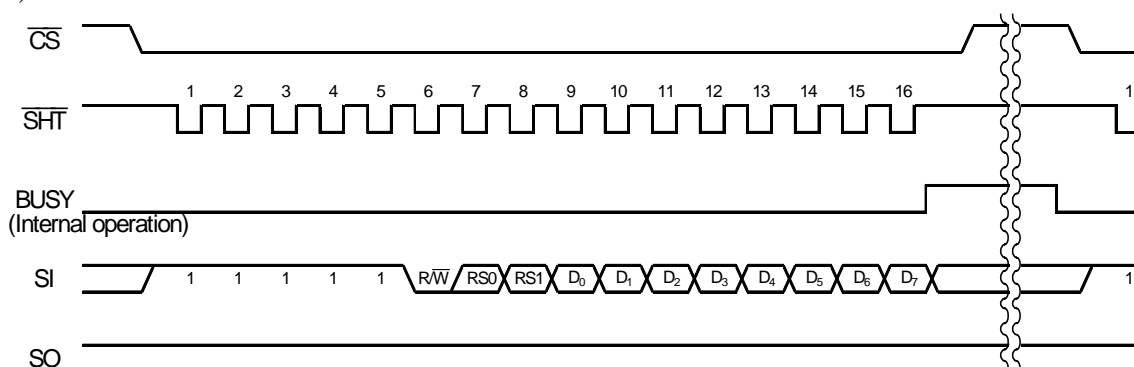

Writing and reading operations are executed in units of 16 bits after the \overline{CS} signal falls down. If the \overline{CS} signal rises up before the completion of 16-bit unit access, this access is ignored.

When the BF bit is "1", the ML9044A cannot accept any other instructions. Before inputting a new instruction, check that the BF bit is "0". Any access when the BF bit is "1" is ignored.

Data format is LSB-first.

Examples of Access in the Serial I/F Mode

1) WRITE MODE

2) READ MODE

Note 1: Higher 5 bits of each instruction must be input at a "H" level.

Note 2: Lower 8 bits are "don't care" when the instructions in the READ MODE are set.

Note 3: After one instruction is input, the next instruction must be input after the \overline{CS} pin is pulled at a "H" level.

Instruction Codes

Table of Instruction Codes

| Instruction | Code | | | | | | | | | | | Function | Execution Time f = 270 kHz |
|-----------------------------|---|-----------------|-----|-----------------|-----------------|-----------------|----------------------------|-----------------|--|--|---|--|---|
| | RS ₁ | RS ₀ | R/W | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ | | |
| Display Clear | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | Clears all the displayed digits of the LCD and sets the DDRAM address 0 in the address counter. The arbitrator data is cleared. | 1.52 ms |
| Cursor Home | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | X | Sets the DDRAM address 0 in the address counter and shifts the display back to the original. The content of the DDRAM remains unchanged. | 1.52 ms |
| Entry Mode Setting | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | I/D | S | Determines the direction of movement of the cursor and whether or not to shift the display. This instruction is executed when data is written or read. | 37 μs |
| Display ON/OFF Control | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | D | C | B | Sets LCD display ON/OFF (D), cursor ON/OFF or cursor-position character blinking ON/OFF. | 37 μs |
| Cursor/Display Shift | 1 | 0 | 0 | 0 | 0 | 0 | 1 | S/C | R/L | X | X | Moves the cursor or shifts the display without changing the content of the DDRAM. | 37 μs |
| Function Setting | 1 | 0 | 0 | 0 | 0 | 1 | DL | N | F | X | X | Sets the interface data length (DL), the number of display lines (N) or the type of character font (F). | 37 μs |
| CGRAM Address Setting | 1 | 0 | 0 | 0 | 1 | ACG | | | | | Sets on CGRAM address. After that, CGRAM data is transferred to and from the CPU. | 37 μs | |
| DDRAM Address Setting | 1 | 0 | 0 | 1 | ADD | | | | | Sets a DDRAM address. After that, DDRAM data is transferred to and from the CPU. | 37 μs | | |
| Busy Flag/ Address Read | 1 | 0 | 1 | BF | ADC | | | | | Reads the Busy Flag (indicating that the ML9044A is operating) and the content of the address counter. | 0 μs | | |
| RAM Data Write | 1 | 1 | 0 | WRITE DATA | | | | | Writes data in DDRAM, ABRAM or CGRAM. | 37 μs | | | |
| RAM Data Read | 1 | 1 | 1 | READ DATA | | | | | Reads data from DDRAM, ABRAM or CGRAM. | 37 μs | | | |
| Arbitrator Display Line Set | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | AS | Sets the arbitrator display line. | 37 μs |
| Contrast Control Data Write | 0 | 0 | 0 | 0 | 0 | 1 | WRITE (Contrast Data) DATA | | | | Writes data to control the contrast of the LCD. | 37 μs | |
| Contrast Control Data Read | 0 | 0 | 1 | 0 | 0 | 0 | READ (Contrast Data) DATA | | | | Reads data to control the contrast of the LCD. | 37 μs | |
| ABRAM Address Setting | 0 | 0 | 0 | 0 | 1 | 1 | AAB | | | | Sets an ABRAM address. After that, ABRAM data is transferred to and from the CPU. | 37 μs | |
| — | I/D = "1" (Increment) I/D = "0" (Decrement) S = "1" (Shifts the display.) S/C = "0" (Moves the cursor.) S/C = "1" (Shifts display.) x: Don't Care

Instruction Codes

An instruction code is a signal sent from the CPU to access the ML9044A. The ML9044A starts operation as instructed by the code received. The busy status of the ML9044A is rather longer than the cycle time of the CPU, since the internal processing of the ML9044A starts at a timing which does not affect the display on the LCD. In the busy status (Busy Flag is "1"), the ML9044A cannot input the Busy Flag Read instruction only. Therefore, the CPU should ensure that the Busy Flag is "0" before sending an instruction code to the ML9044A.

1) Display Clear

| | RS ₁ | RS ₀ | R \bar{W} | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-------------------|-----------------|-----------------|-------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Instruction Code: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

When this instruction is executed, the LCD display including arbitrator display is cleared and the I/D entry mode is set to "Increment". The value of "S" (Display shifting) remains unchanged. The position of the cursor or blink being displayed moves to the left end of the LCD (or the left end of the line 1 in the 2-line display mode).

Note: All DDRAM and ABRAM data turn to "20" and "00" in hexadecimal, respectively. The value of the address counter (ADC) turns to the one corresponding to the address "00" (hexadecimal) of the DDRAM.

The execution time of this instruction is 1.52 ms (maximum) at an oscillation frequency of 270 kHz.

2) Cursor Home

| | RS ₁ | RS ₀ | R \bar{W} | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-------------------|-----------------|-----------------|-------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Instruction code: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | × |

×: Don't Care

When this instruction is executed, the cursor or blink position moves to the left end of the LCD (or the left end of line 1 in the 2-line display mode). If the display has been shifted, the display returns to the original display position before shifting.

Note: The value of the address counter (ADC) goes to the one corresponding to the address "00" (hexadecimal) of the DDRAM.

The execution time of this instruction is 1.52 ms (maximum) at an oscillation frequency of 270 kHz.

3) Entry Mode Setting

| | RS ₁ | RS ₀ | R \bar{W} | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-------------------|-----------------|-----------------|-------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Instruction code: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | I/D | S |

- (1) When the I/D is set, the cursor or blink shifts to the right by 1 character position (I/D = "1"; increment) or to the left by 1 character position (I/D = "0"; decrement) after an 8-bit character code is written to or read from the DDRAM. At the same time, the address counter (ADC) is also incremented by 1 (when I/D = "1"; increment) or decremented by 1 (when I/D = "0"; decrement). After a character pattern is written to or read from the CGRAM, the address counter (ADC) is incremented by 1 (when I/D = "1"; increment) or decremented by 1 (when I/D = "0"; decrement).

Also after data is written to or read from the ABRAM, the address counter (ADC) is incremented by 1 (when I/D = "1"; increment) or decremented by 1 (when I/D = "0"; decrement).

- (2) When S = "1", the cursor or blink stops and the entire display shifts to the left (I/D = "1") or to the right (I/D = "0") by 1 character position after a character code is written to the DDRAM.

In the case of S = "1", when a character code is read from the DDRAM, when a character pattern is written to or read from the CGRAM or when data is written to or read from the ABRAM, normal read/write is carried out without shifting of the entire display. (The entire display does not shift, but the cursor or blink shifts to the right (I/D = "1") or to the left (I/D = "0") by 1 character position.)

When S = "0", the display does not shift, but normal write/read is performed.

Note: The execution time of this instruction is 37 μ s (maximum) at an oscillation frequency of 270 kHz.

4) Display ON/OFF Control

| | RS ₁ | RS ₀ | R \bar{W} | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-------------------|-----------------|-----------------|-------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Instruction code: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | D | C | B |

- (1) The "D" bit (DB₂) of this instruction determines whether or not to display character patterns on the LCD. When the "D" bit is "1", character patterns are displayed on the LCD.

When the "D" bit is "0", character patterns are not displayed on the LCD and the cursor/blinking also disappear.

Note: Unlike the Display Clear instruction, this instruction does not change the character code in the DDRAM and ABRAM.

- (2) When the "C" bit (DB₁) is "0", the cursor turns off. When both the "C" and "D" bits are "1", the cursor turns on.

- (3) When the "B" bit (DB₀) is "0", blinking is canceled. When both the "B" and "D" bits are "1", blinking is performed.

In the Blinking mode, all dots including those of the cursor, the character pattern and the cursor are alternately displayed.

Note: The execution time of this instruction is 37 μ s (maximum) at an oscillation frequency of 270 kHz.

5) Cursor/Display Shift

| | RS ₁ | RS ₀ | R \bar{W} | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-------------------|-----------------|-----------------|-------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Instruction code: | 1 | 0 | 0 | 0 | 0 | 0 | 1 | S/C | R/L | × | × |

×: Don't Care

- S/C = "0", R/L = "0" This instruction shifts left the cursor and blink positions by 1 (decrements the content of the ADC by 1).
- S/C = "0", R/L = "1" This instruction shifts right the cursor and blink positions by 1 (increments the content of the ADC by 1).
- S/C = "1", R/L = "0" This instruction shifts left the entire display by 1 character position. The cursor and blink positions move to the left together with the entire display. The Arbitrator display is not shifted. (The content of the ADC remains unchanged.)
- S/C = "1", R/L = "1" This instruction shifts right the entire display by 1 character position. The cursor and blink positions move to the right together with the entire display. The Arbitrator display is not shifted. (The content of the ADC remains unchanged.)

In the 2-line mode, the cursor or blink moves from the first line to the second line when the cursor at digit 40 (27; hex) of the first line is shifted right.

When the entire display is shifted, the character pattern, cursor or blink will not move between the lines (from line 1 to line 2 or vice versa).

Note: The execution time of this instruction is 37 μ s at an oscillation frequency (OSC) of 270 kHz.

6) Function Setting

| | RS ₁ | RS ₀ | R \bar{W} | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-------------------|-----------------|-----------------|-------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Instruction code: | 1 | 0 | 0 | 0 | 0 | 1 | DL | N | F | × | × |

×: Don't Care

- When the "DL" bit (DB₄) of this instruction is "1", the data transfer to and from the CPU is performed once by the use of 8 bits DB₇ to DB₀.
When the "DL" bit (DB₄) of this instruction is "0", the data transfer to and from the CPU is performed twice by the use of 4 bits DB₇ to DB₄.
- The 2-line display mode is selected when the "N" bit (DB₃) of this instruction is "1". The 1-line display mode is selected when the "N" bit is "0".
- The character font represented by 5 × 7 dots is selected when the "F" bit (DB₂) of this instruction is "1". The character font represented by 5 × 10 dots is selected when the "F" bit is "1" and the "N" bit is "0".
After the ML9044A is powered on, this function setting should be carried out before execution of any instruction except the Busy Flag Read. After this function setting, no instructions other than the DL Set instruction can be executed. In the Serial I/F Mode, DL setting is ignored.

| N | F | Number of display lines | Font size | Duty | Number of biases | Number of common signals |
|---|---|-------------------------|-----------|------|------------------|--------------------------|
| 0 | 0 | 1 | 5 × 7 | 1/9 | 4 | 9 |
| 0 | 1 | 1 | 5 × 10 | 1/12 | 4 | 12 |
| 1 | 0 | 2 | 5 × 7 | 1/17 | 5 | 17 |
| 1 | 1 | 2 | 5 × 7 | 1/17 | 5 | 17 |

Note: The execution time of this instruction is 37 μ s at an oscillation frequency (OSC) of 270 kHz.

7) CGRAM Address Setting

| | RS ₁ | RS ₀ | R \bar{W} | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-------------------|-----------------|-----------------|-------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Instruction code: | 1 | 0 | 0 | 0 | 1 | C ₅ | C ₄ | C ₃ | C ₂ | C ₁ | C ₀ |

This instruction sets the CGRAM address to the data represented by the bits C₅ to C₀ (binary).

The CGRAM addresses are valid until DDRAM or ABRAM addresses are set.

The CPU writes or reads character patterns starting from the one represented by the CGRAM address bits C₅ to C₀ set in the instruction code at that time.

Note: The execution time of this instruction is 37 μ s at an oscillation frequency (OSC) of 270 kHz.

8) DDRAM Address Setting

| | RS ₁ | RS ₀ | R \bar{W} | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-------------------|-----------------|-----------------|-------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Instruction code: | 1 | 0 | 0 | 1 | D ₆ | D ₅ | D ₄ | D ₃ | D ₂ | D ₁ | D ₀ |

This instruction sets the DDRAM address to the data represented by the bits D₆ to D₀ (binary).

The DDRAM addresses are valid until CGRAM or ABRAM addresses are set.

The CPU writes or reads character codes starting from the one represented by the DDRAM address bits D₆ to D₀ set in the instruction code at that time.

In the 1-line mode (the "N" bit is "0"), the DDRAM address represented by bits D₆ to D₀ (binary) should be in the range "00" to "4F" in hexadecimal.

In the 2-line mode (the "N" bit is "1"), the DDRAM address represented by bits D₆ to D₀ (binary) should be in the range "00" to "27" or "40" to "67" in hexadecimal.

If an address other than above is input, the ML9044A cannot properly write a character code in or read it from the DDRAM.

Note: The execution time of this instruction is 37 μ s at an oscillation frequency (OSC) of 270 kHz.

9) DDRAM/ABRAM/CGRAM Data Write

| | RS ₁ | RS ₀ | R \bar{W} | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-------------------|-----------------|-----------------|-------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Instruction code: | 1 | 1 | 0 | E ₇ | E ₆ | E ₅ | E ₄ | E ₃ | E ₂ | E ₁ | E ₀ |

A character code (E₇ to E₀) is written to the DDRAM, Display-ON data (E₇ to E₀) to the ABRAM or a character pattern (E₇ to E₀) to the CGRAM.

The DDRAM, ABRAM or CGRAM is selected at the preceding address setting.

After data is written, the address counter (ADC) is incremented or decremented as set by the Entry Mode Setting instruction (see 3).

Note: The execution time of this instruction is 37 μ s at an oscillation frequency (OSC) of 270 kHz.

10) Busy Flag/Address Counter Read (Execution time: 0 μ s)

| | RS ₁ | RS ₀ | R \bar{W} | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-------------------|-----------------|-----------------|-------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Instruction code: | 1 | 0 | 1 | BF | O ₆ | O ₅ | O ₄ | O ₃ | O ₂ | O ₁ | O ₀ |

The “BF” bit (DB7) of this instruction tells whether the ML9044A is busy in internal operation (BF = “1”) or not (BF = “0”).

When the “BF” bit is “1”, the ML9044A cannot accept any other instructions. Before inputting a new instruction, check that the “BF” bit is “0”.

When the “BF” bit is “0”, the ML9044A outputs the correct value of the address counter. The value of the address counter is equal to the DDRAM, ABRAM or CGRAM address. Which of the DDRAM, ABRAM and CGRAM addresses is set in the counter is determined by the preceding address setting.

When the “BF” bit is “1”, the value of the address counter is not always correct because it may have been incremented or decremented by 1 during internal operation.

11) DDRAM/ABRAM/CGRAM Data Read

| | RS ₁ | RS ₀ | R \bar{W} | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-------------------|-----------------|-----------------|-------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Instruction code: | 1 | 1 | 1 | P ₇ | P ₆ | P ₅ | P ₄ | P ₃ | P ₂ | P ₁ | P ₀ |

A character code (P₇ to P₀) is read from the DDRAM, Display-ON data (P₇ to P₀) from the ABRAM or a character pattern (P₇ to P₀) from the CGRAM.

The DDRAM, ABRAM or CGRAM is selected at the preceding address setting.

After data is read, the address counter (ADC) is incremented or decremented as set by the Entry Mode Setting instruction (see 3).

Note: Conditions for reading correct data

- (1) The DDRAM, ABRAM or CGRAM Setting instruction is input before this data read instruction is input.
- (2) When reading a character code from the DDRAM, the Cursor/Display Shift instruction (see 5) is input before this Data Read instruction is input.
- (3) When two or more consecutive RAM Data Read instructions are executed, the following read data is correct.
Correct data is not output under conditions other than the cases (1), (2) and (3) above.

Note: The execution time of this instruction is 37 μ s at an oscillation frequency (OSC) of 270 kHz.

Expansion Instruction Codes

The busy status of the ML9044A is rather longer than the cycle time of the CPU, since the internal processing of the ML9044A starts at a timing which does not affect the display on the LCD. In the busy status (Busy Flag is "1"), the ML9044A executes the Busy Flag Read instruction only. Therefore, the CPU should ensure that the Busy Flag is "0" before sending an expansion instruction code to the ML9044A.

1) Arbitrator Display Line Set

| Expansion instruction code: | RS ₁ | RS ₀ | R/W | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-----------------------------|-----------------|-----------------|-----|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | AS |

This expansion instruction code sets the Arbitrator display line. The relationship between the status of this bit and the common outputs is as follows:

For display examples, refer to LCD Drive Waveforms section.

| CSR | duty | AS bit | Shift direction | Arbitrator's common pin |
|-----|------|--------|-----------------|-------------------------|
| L | 1/9 | L | COM1→COM9 | COM9 |
| L | 1/9 | H | COM1→COM9 | COM1 |
| L | 1/12 | L | COM1→COM12 | COM12 |
| L | 1/12 | H | COM1→COM12 | COM1 |
| L | 1/17 | L | COM1→COM17 | COM17 |
| L | 1/17 | H | COM1→COM17 | COM1 |
| H | 1/9 | L | COM9→COM1 | COM1 |
| H | 1/9 | H | COM9→COM1 | COM9 |
| H | 1/12 | L | COM12→COM1 | COM1 |
| H | 1/12 | H | COM12→COM1 | COM12 |
| H | 1/17 | L | COM17→COM1 | COM1 |
| H | 1/17 | H | COM17→COM1 | COM17 |

Note: The execution time of this instruction is 37 μs at an oscillation frequency (OSC) of 270 kHz.

2) Contrast Adjusting Data Write

| Expansion instruction code: | RS ₁ | RS ₀ | R/W | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-----------------------------|-----------------|-----------------|-----|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| | 0 | 0 | 0 | 0 | 0 | 1 | F ₄ | F ₃ | F ₂ | F ₁ | F ₀ |

This instruction writes contrast adjusting data (F₄ to F₀) to the contrast register.

After contrast adjusting data is written in the register, the potential (VLCD) output to the V₅ pin varies according to the data written.

The VLCD becomes maximum when the content of the contrast register is "1F" (hexadecimal) and becomes minimum when it is "00" (hexadecimal).

Note: The execution time of this instruction is 37 μs at an oscillation frequency (OSC) of 270 kHz.

3) Contrast Adjusting Data Read

| | RS ₁ | RS ₀ | R/W | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-----------------------------|-----------------|-----------------|-----|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Expansion instruction code: | 0 | 0 | 1 | 0 | 0 | 0 | G ₄ | G ₃ | G ₂ | G ₁ | G ₀ |

This instruction reads contrast adjusting data (G₄ to G₀) from the contrast register.

Note: The execution time of this instruction is 37 μs at an oscillation frequency (OSC) of 270 kHz.

4) ABRAM Address Setting

| | RS ₁ | RS ₀ | R/W | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-----------------------------|-----------------|-----------------|-----|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Expansion instruction code: | 0 | 0 | 1 | 0 | 1 | 1 | H ₄ | H ₃ | H ₂ | H ₁ | H ₀ |

This instruction sets the ABRAM address to the data represented by the bits H₄ to H₀ (binary).

The ABRAM addresses are valid until CGRAM or DDRAM addresses are set.

The CPU writes or reads the Display-ON data starting from the one represented by the ABRAM address bits H₄ to H₀ set in the instruction code at that time.

When the ABRAM address represented by bits H₄ to H₀ (binary) is in the range "00" to "17" in hexadecimal, data is output to the LCD as the arbitrator.

Note: The execution time of this instruction is 37 μs at an oscillation frequency (OSC) of 270 kHz.

Examples of Combinations of ML9044A and LCD Panel

- (1) Driving the LCD of one 24-character line under the conditions of the 1-line display mode and the character font of 5×7 dots

(1/9 duty, AS = "0", CSR = "L", SSR = "H")

- COM₁₀ to COM₁₇ output Display-OFF common signals.

(1/9 duty, AS = "1", CSR = "L", SSR = "H")

- COM₁₀ to COM₁₇ output Display-OFF common signals.

(1/9 duty, AS = "0", CSR = "H", SSR = "L")

- COM₁₀ to COM₁₇ output Display-OFF common signals.

(1/9 duty, AS = "1", CSR = "H", SSR = "L")

- COM₁₀ to COM₁₇ output Display-OFF common signals.

- (2) Driving the LCD of one 24-character line under the conditions of the 1-line display mode and the character font of 5×10 dots

(1/12 duty, AS = "0", CSR = "L", SSR = "H")

- COM₁₃ to COM₁₇ output Display-OFF common signals.

(1/12 duty, AS = "1", CSR = "L", SSR = "H")

- COM₁₃ to COM₁₇ output Display-OFF common signals.

(1/12 duty, AS = "0", CSR = "H", SSR = "L")

- COM₁₃ to COM₁₇ output Display-OFF common signals.

(1/12 duty, AS = "1", CSR = "H", SSR = "L")

- COM₁₃ to COM₁₇ output Display-OFF common signals.

- (3) Driving the LCD of two 24-character lines under the conditions of the 2-line display mode and the character font of 5×7 dots

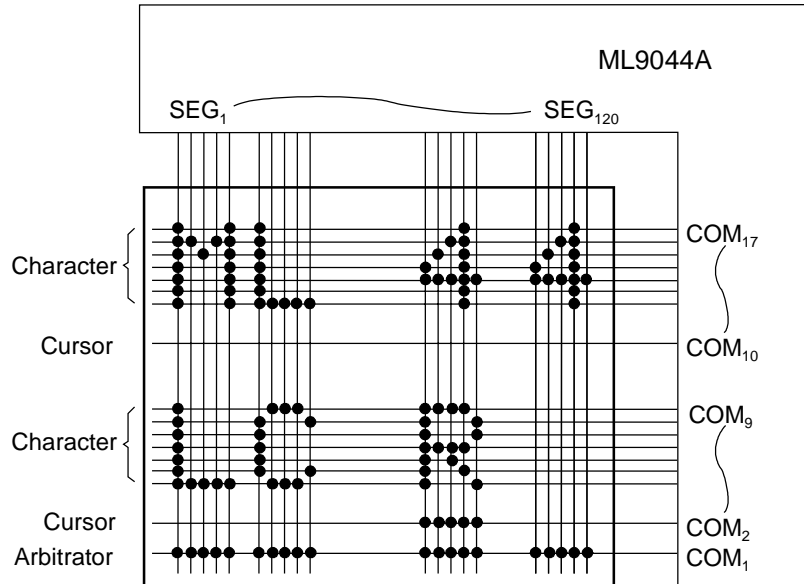

(1/17 duty, AS = "0", CSR = "L", SSR = "H")

(1/17 duty, AS = "1", CSR = "L", SSR = "H")

(1/17 duty, AS = "0", CSR = "H", SSR = "L")

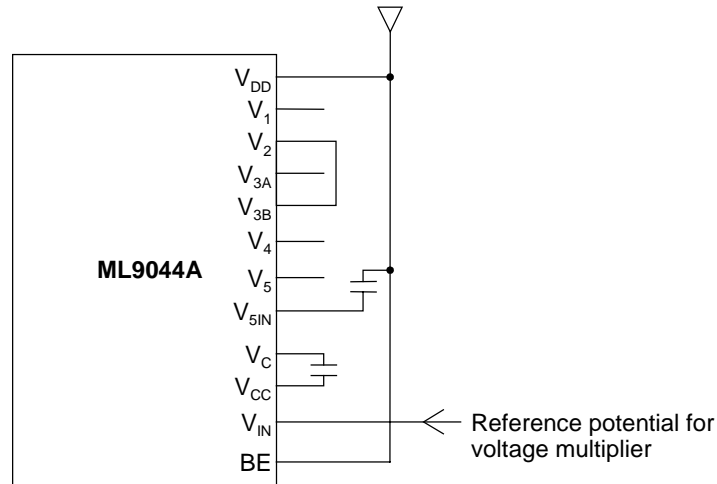

(1/17 duty, AS = "1", CSR = "H", SSR = "L")

EXAMPLES OF VLCD GENERATION CIRCUITS

- With 1/4bias, a built-in contrast adjusting circuit and a voltage multiplier

- With 1/4 bias, a built-in contrast adjusting circuit and the V_5 level input from an external circuit

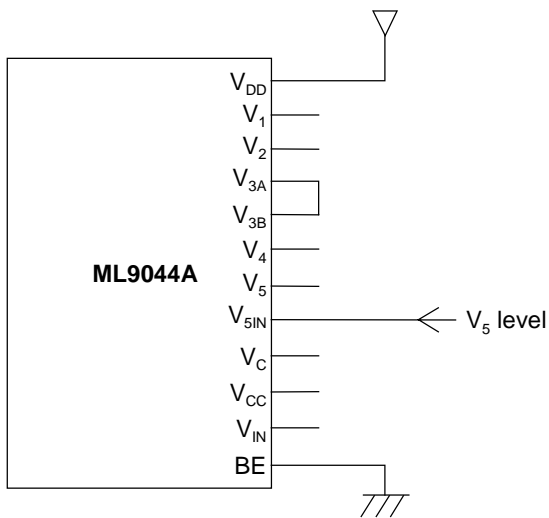

- With 1/4 bias, no built-in contrast adjusting circuit and the V_5 level input from an external circuit

- With 1/5 bias, a built-in contrast adjusting circuit and a voltage multiplier

- With 1/5 bias, a built-in contrast adjusting circuit and the V_5 level input from an external circuit

- With 1/5 bias, no built-in contrast adjusting circuit and the V_5 level input from an external circuit

LCD Drive Waveforms

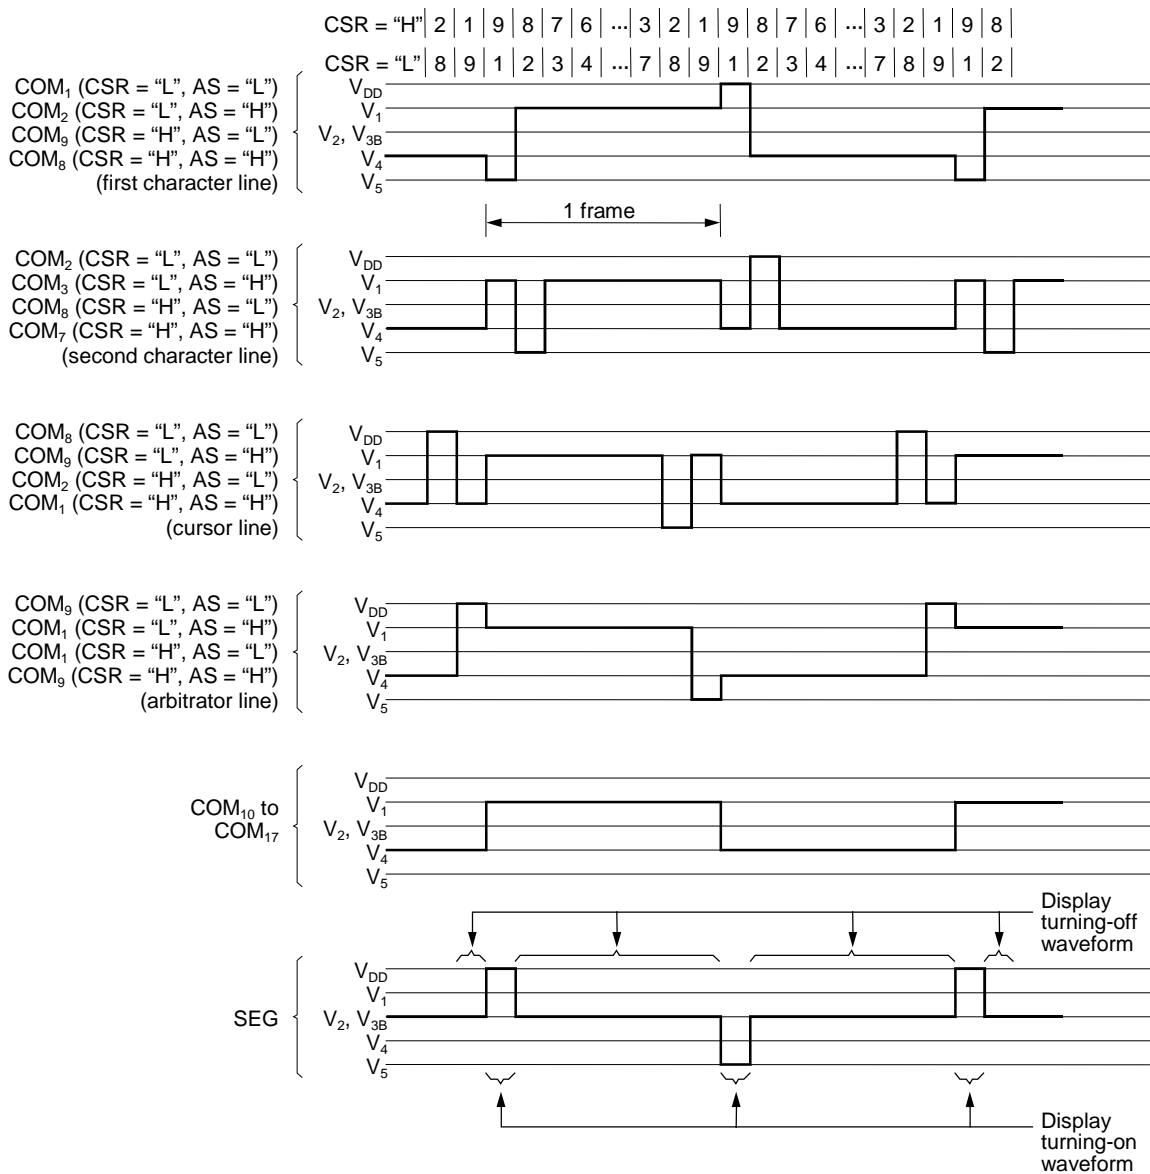

The COM and SEG waveforms (AC signal waveforms for display) vary according to the duty (1/9, 1/12 and 1/17 duties). See 1) to 3) below.

The relationship between the duty ratio and the frame frequency is as follows:

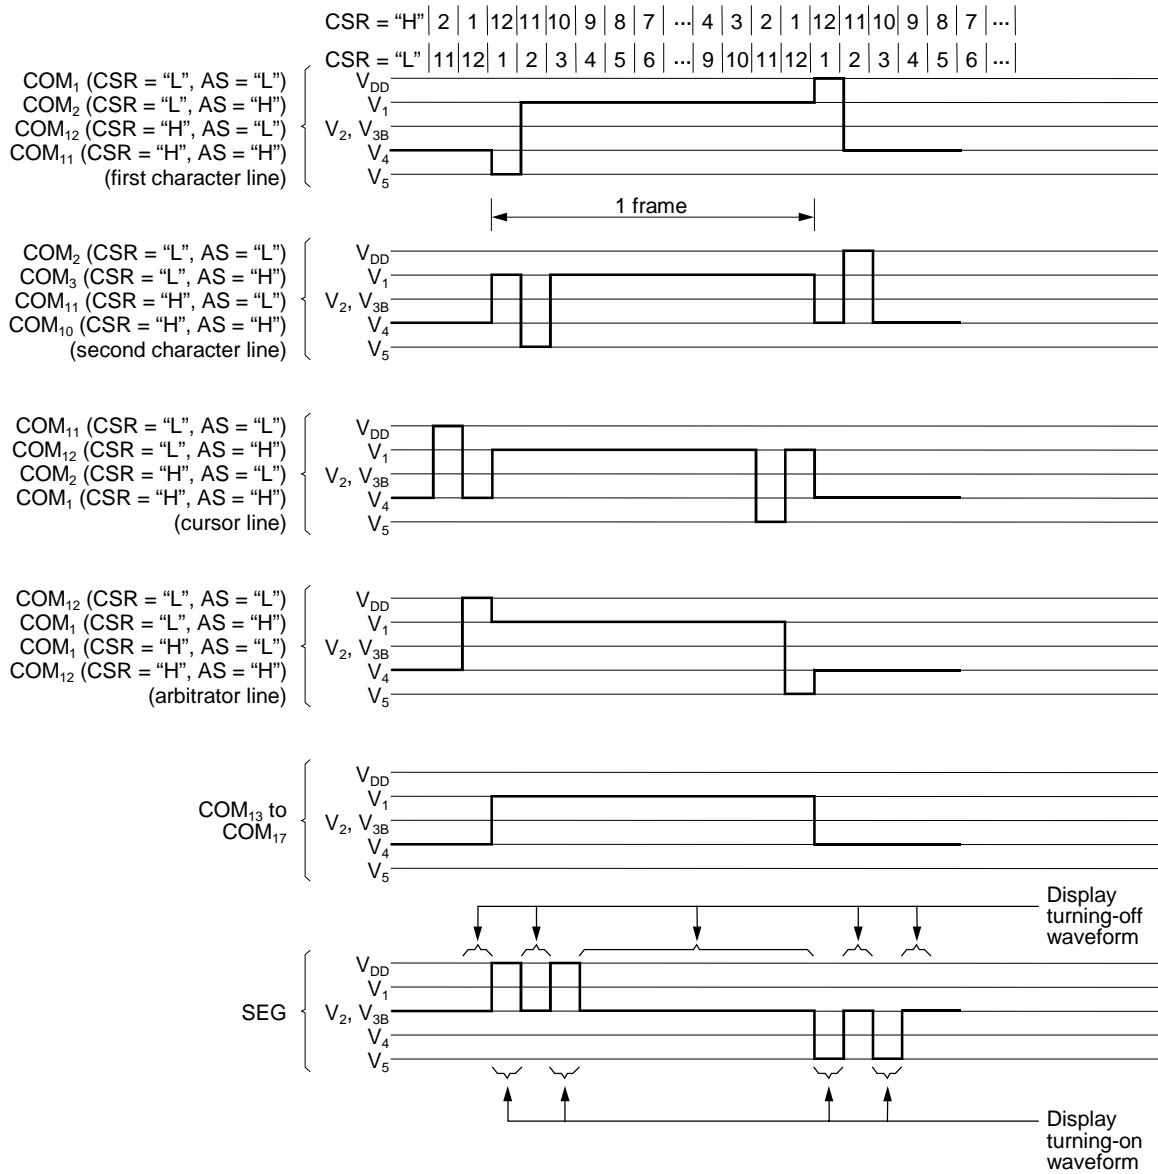

| Duty ratio | Frame Frequency |
|------------|-----------------|
| 1/9 | 75.0 Hz |
| 1/12 | 56.3 Hz |
| 1/17 | 79.4 Hz |

Note: At an oscillation frequency (OSC) of 270 kHz

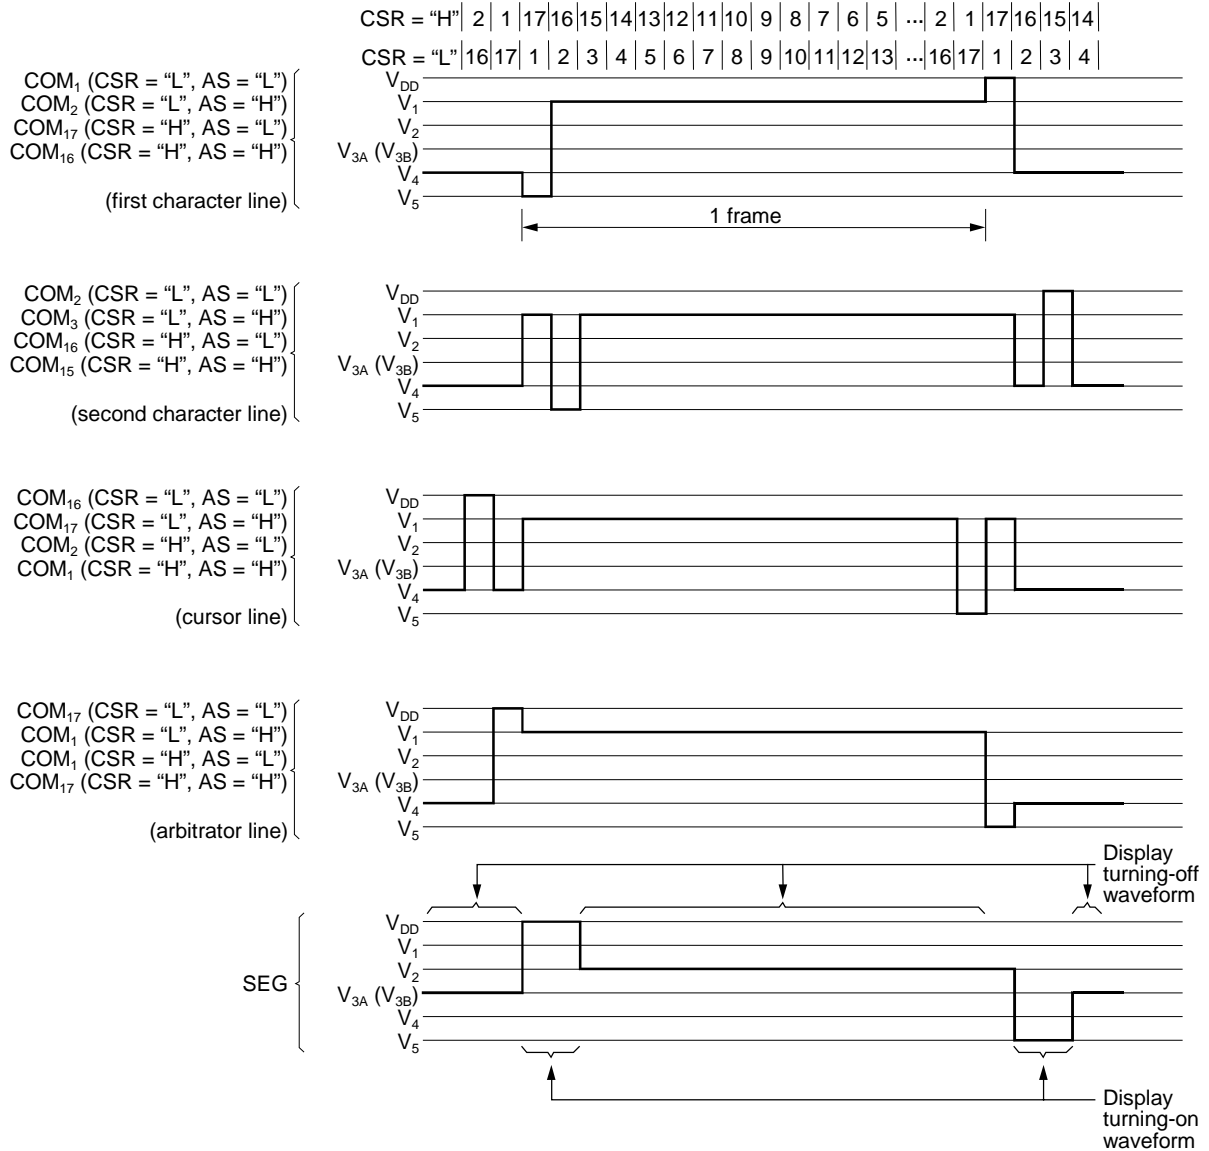

1) COM and SEG Waveforms on 1/9 Duty

2) COM and SEG Waveforms on 1/12 Duty

3) COM and SEG Waveforms on 1/17 Duty

Initial Setting of Instructions

- (a) Data transfer from and to the CPU using 8 bits of DB₀ to DB₇
- 1) Turn on the power.
 - 2) Wait for 15 ms or more after V_{DD} has reached 2.7 V or higher.
 - 3) Set "8 bits" with the Function Setting instruction.
 - 4) Wait for 4.1 ms or more.
 - 5) Set "8 bits" with the Function Setting instruction.
 - 6) Wait for 100 μs or more.
 - 7) Set "8 bits" with the Function Setting instruction.
 - 8) Check the Busy Flag for No Busy (or wait for 100 μs or more).
 - 9) Set "8 bits", "Number of LCD lines" and "Font size" with the Function Setting instruction.
(After this, the number of LCD lines and the font size cannot be changed.)
 - 10) Check the Busy Flag for No Busy.
 - 11) Execute the Display ON/OFF Control Instruction, Display Clear Instruction, Entry Mode Setting instruction and Arbitrator Display Line Setting Instruction.
 - 12) Check the Busy Flag for No Busy.
 - 13) Initialization is completed.

An example of instruction code for 3), 5) and 7)

| RS ₁ | RS ₀ | R \bar{W} | DB ₇ | DB ₆ | DB ₅ | DB ₄ | DB ₃ | DB ₂ | DB ₁ | DB ₀ |
|-----------------|-----------------|-------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| 1 | 0 | 0 | 0 | 0 | 1 | 1 | × | × | × | × |

×: Don't Care

- (b) Data transfer from and to the CPU using 4 bits of DB₄ to DB₇
- 1) Turn on the power.
 - 2) Wait for 15 ms or more after V_{DD} has reached 2.7 V or higher.
 - 3) Set "8 bits" with the Function Setting instruction.
 - 4) Wait for 4.1 ms or more.
 - 5) Set "8 bits" with the Function Setting instruction.
 - 6) Wait for 100 μs or more.
 - 7) Set "8 bits" with the Function Setting instruction.
 - 8) Check the Busy Flag for No Busy (or wait for 100 μs or longer).
 - 9) Set "4 bits" with the Function Setting instruction.
 - 10) Wait for 100 μs or longer.
 - 11) Set "4 bits", "Number of LCD lines" and "Font size" with the Function Setting instruction. (After this, the number of LCD lines and the font size cannot be changed.)
 - 12) Check the Busy Flag for No Busy.
 - 13) Execute the Display ON/OFF Control Instruction, Display Clear Instruction, Entry Mode Setting instruction and Arbitrator Display Line Setting Instruction.
 - 14) Check the Busy Flag for No Busy.
 - 15) Initialization is completed.

An example of instruction code for 3), 5) and 7)

| RS ₁ | RS ₀ | R \bar{W} | DB ₇ | DB ₆ | DB ₅ | DB ₄ |
|-----------------|-----------------|-------------|-----------------|-----------------|-----------------|-----------------|
| 1 | 0 | 0 | 0 | 0 | 1 | 1 |

An example of instruction code for 9)

| RS ₁ | RS ₀ | R/W | DB ₇ | DB ₆ | DB ₅ | DB ₄ |
|-----------------|-----------------|-----|-----------------|-----------------|-----------------|-----------------|
| 1 | 0 | 0 | 0 | 0 | 1 | 0 |

*: From 11), input data twice by the use of 4-bit data.

*: In 13), check the Busy Flag for No Busy before executing each instruction.

(c) Data transfer from and to the CPU using the serial I/F

- 1) Turn on the power.
- 2) Wait for 15 ms or more after V_{DD} has reached 2.7 V or higher.
- 3) Check the busy flag for No Busy.
- 4) Set "Number of LCD lines" and "Font size" with the Function Setting Instruction.(After this, the number of LCD lines and the font size cannot be changed.)
- 5) Check the busy flag for No Busy.
- 6) Execute the Display ON/OFF Control Instruction, the Display Clear Instruction, the Entry Mode Instruction and the Arbitrator Display Line Setting Instruction.
- 7) Check the busy flag for No Busy.
- 8) Initialization is completed.

*: In 6), check the Busy Flag for No Busy before executing each instruction.

ML9044A-xxACVWA ALIGNMENT MARK SPECIFICATION

Alignment Mark Coordinates

| Alignment Mark | X (μm) | Y (μm) |
|----------------|---------------------|---------------------|
| A | -5100 | 960 |
| B | 5100 | 960 |
| C | 5100 | -840 |

Alignment Mark Layer

Metal layers

Alignment Mark Specification

| Symbol | Parameter | Mark | Size (μm) |
|--------|--|--------|------------------------|
| a | Alignment Mark Width | — | 25.2 |
| b | Alignment Mark Size | — | 100.2 |
| c | Distance between Mark and Internal Pattern (MIN) | Mark A | 26.8 |
| | | Mark B | 17.1 |
| | | Mark C | 87.3 |
| d | Distance between Mark and Adjacent Pad Metal Layer (MIN) | Mark A | 57.3 |
| | | Mark B | 57.3 |
| | | Mark C | 36.3 |
| e | Distance between Mark and Adjacent Pad Bump (MIN) | Mark A | 69.1 |
| | | Mark B | 69.1 |
| | | Mark C | 49.0 |

ML9044A-xxB CVWA PAD CONFIGURATION

Pad Layout

Chip Size: 10.62 × 2.55 mm
 Chip Thickness: 625±20 μm
 Bump Size (1): 72 × 72 μm (PAD No. 1-55)
 Bump Size (2): 54 × 96 μm (PAD No. 56-175)

Pad Coordinates

Note: The ML9044A-xxB does not have the dummy pads corresponding to the pad numbers 56 to 62 and 183 to 189 for the ML9044A-xxA.

ML9044A-xxBCVWA ALIGNMENT MARK SPECIFICATION

Alignment Mark Coordinates

| Alignment Mark | X (μm) | Y (μm) |
|----------------|--------|--------|
| A | -5100 | 960 |
| B | 5100 | 960 |
| C | 5100 | -840 |

Alignment Mark Layer

Metal layers

Alignment Mark Specification

| Symbol | Parameter | Mark | Size (μm) |
|--------|--|--------|-----------|
| a | Alignment Mark Width | — | 25.2 |
| b | Alignment Mark Size | — | 100.2 |
| c | Distance between Mark and Internal Pattern (MIN) | Mark A | 26.8 |
| | | Mark B | 17.1 |
| | | Mark C | 87.3 |
| d | Distance between Mark and Adjacent Pad Metal Layer (MIN) | Mark A | 57.3 |
| | | Mark B | 57.3 |
| | | Mark C | 164.7 |
| e | Distance between Mark and Adjacent Pad Bump (MIN) | Mark A | 69.1 |
| | | Mark B | 69.1 |
| | | Mark C | 173.7 |

ML9044A-xxA/xxBCVWA GOLD BUMP SPECIFICATION

Gold Bump Specification

(Unit: μm)

| Symbol | Parameter | MIN | TYP | MAX |
|--------|---|-----|-----|-----|
| A | Bump Pitch (Min Section: Output Section) | 84 | — | — |
| B | Bump Size (Output Section: Pitch Direction) | 49 | 54 | 59 |
| C | Bump Size (Output Section: Depth Direction) | 91 | 96 | 101 |
| D | Bump-to-Bump Distance (Output Section: Pitch Direction) | 25 | 30 | 35 |
| E | Bump Size (Input Section: Pitch Direction) | 67 | 72 | 77 |
| F | Bump Size (Input Section: Depth Direction) | 67 | 72 | 77 |
| G | Bump-to-Bump Distance (Input Section: Pitch Direction) | 112 | 117 | 122 |
| H | Sliding of Total Bump Pitches | — | — | 2 |
| I | Bump Height | 10 | 15 | 20 |
| | Bump Height Dispersion Inside Chip (Range) | — | — | 4 |
| J | Bump Edge Height | — | — | 5 |
| K | Shear Strength (g) | 30 | — | — |
| L | Bump Hardness (Hv: 25 g load) | 50 | 90 | 130 |

■ Chip Size; 10.62 mm \times 2.55 mm

■ Chip Thickness; 625 \pm 20 μm

REVISION HISTORY

| Document No. | Date | Page | | Description |
|--------------|--------------|--------------------------------|-----------------|---|
| | | Previous Edition | Current Edition | |
| PEDL9044A-01 | Dec. 2001 | – | – | Preliminary first edition |
| PEDL9044A-02 | Feb. 1, 2002 | 5 | 5 | Changed descriptions of Symbol BE. Changed descriptions of Symbols V_C and V_{CC} . |
| | | 6 | 6 | Changed description of Symbol S/\bar{P} . Added Symbol DUMMY and descriptions. |
| | | 8 | 8 | Integrated Parameters “H” Input Voltage 1” and “H” Input Voltage 2”, and Parameters “L” Input Voltage 1” and “L” Input Voltage 2”. Changed Min. value of “L” input voltage” from –0.3 to 0. Changed condition of Parameter “Input Current 2” from $V_1 = V_{DD}$ to $V_1 = GND$. |
| | | 10 | 10 | Changed Note 6. |
| | | 12 | 12 | Added Note. |
| | | 13 | 13 | Added \overline{CS} “H” pulse width. |
| | | 32 | 32 | Changed timing diagrams. Added Note 3. |
| | | 35 | 35 | Changed caption 4) from “Display Mode Setting” to “Display ON/OFF Control”. Partially changed Section (1) of 4). |
| | | 36 | 36 | Partially changed Section (3) of 6). |
| | | 37 | 37 | Partially changed Section 8). |
| 38 | 38 | Partially changed Section 11). | | |
| PEDL9044A-03 | Feb. 6, 2002 | 1 | 1 | Partially changed the content of Section “FEATURES”. |
| | | 8 | 8 | Changed a symbol in column “Applicable pin” from CS to \overline{CS} . |
| | | 19 | 19 | Partially changed Section (1) of 1). |
| | | 20 | 20 | Partially changed Section (2). |
| | | 21 | 21 | Partially changed Section “Arbitrator RAM (ABRAM)”. |
| | | 27 | 27 | Changed the figure for ADC. |
| | | 35 | 35 | Partially changed Section 3). |
| | | 37 | 37 | Partially changed Section 9). |
| 40 | 40 | Partially changed Section 4). | | |
| PEDL9044A-04 | Apr. 8, 2002 | 37 | 37 | Partially changed Section 7) and Section 8). |
| | | 40 | 40 | Partially changed Section 4). |
| | | 53 | 53 | Partially added the content of Section 4) in (C). |

NOTICE

1. The information contained herein can change without notice owing to product and/or technical improvements. Before using the product, please make sure that the information being referred to is up-to-date.
2. The outline of action and examples for application circuits described herein have been chosen as an explanation for the standard action and performance of the product. When planning to use the product, please ensure that the external conditions are reflected in the actual circuit, assembly, and program designs.
3. When designing your product, please use our product below the specified maximum ratings and within the specified operating ranges including, but not limited to, operating voltage, power dissipation, and operating temperature.
4. Oki assumes no responsibility or liability whatsoever for any failure or unusual or unexpected operation resulting from misuse, neglect, improper installation, repair, alteration or accident, improper handling, or unusual physical or electrical stress including, but not limited to, exposure to parameters beyond the specified maximum ratings or operation outside the specified operating range.
5. Neither indemnity against nor license of a third party's industrial and intellectual property right, etc. is granted by us in connection with the use of the product and/or the information and drawings contained herein. No responsibility is assumed by us for any infringement of a third party's right which may result from the use thereof.
6. The products listed in this document are intended for use in general electronics equipment for commercial applications (e.g., office automation, communication equipment, measurement equipment, consumer electronics, etc.). These products are not authorized for use in any system or application that requires special or enhanced quality and reliability characteristics nor in any system or application where the failure of such system or application may result in the loss or damage of property, or death or injury to humans. Such applications include, but are not limited to, traffic and automotive equipment, safety devices, aerospace equipment, nuclear power control, medical equipment, and life-support systems.
7. Certain products in this document may need government approval before they can be exported to particular countries. The purchaser assumes the responsibility of determining the legality of export of these products and will take appropriate and necessary steps at their own expense for these.
8. No part of the contents contained herein may be reprinted or reproduced without our prior permission.
