32-Bit Duplex/Triplex (1/2 duty / 1/3 duty) VF Controller/Driver with Digital Dimming

GENERAL DESCRIPTION

The ML9212 is a full CMOS controller/driver for Duplex or Triplex (1/2 duty or 1/3 duty) vacuum fluorescent display tube. It consists of a 32-segment driver multiplexed to drive up to 96 segments, and 10-bit digital dimming circuit.

ML9212 features a selection of a master mode and a slave mode, and therefore it can be used to expand segments for the VFD driver with keyscan and A/D converter function.

ML9212 provides an interface with a microcontroller only by three signal lines: DATA IN, CLOCK and CS.

FEATURES

| • Logic supply voltage (V _{DD}) | : 4.5 to 5.5 V |
|--|--|
| • Driver supply voltage (V _{DISP}) | : 8 to 18 V |
| • Duplex/Triplex (1/2 duty / 1/3 duty) sel | ectable |
| $DUP/\overline{TRI} = 1/2$ duty selectable at "H" 1 | evel |
| $DUP/\overline{TRI} = 1/3$ duty selectable at "L" le | evel |
| • Number of display segments | |
| Max. 64-segment display (during 1/2 du | uty mode) |
| Max. 96-segment display (during 1/3 du | uty mode) |
| Master/Slave selectable | |
| $M/\overline{S} = Master mode selectable at "H" le$ | evel |
| M/\overline{S} = Slave mode selectable at "L" lev | el |
| • Interface with a microcontroller | |
| Three lines: CS, CLOCK, and DATA I | N |
| • 32-segment driver outputs | : $I_{OH} = -5$ mA at $V_{OH} = V_{DISP}$ -0.8 V (SEG1 to 22) |
| (can be directly connected to VFD tube | : $I_{OH} = -10 \text{ mA}$ at $V_{OH} = V_{DISP} - 0.8 \text{ V}$ (SEG23 to 32) |
| and require no external resisters) | : $I_{OL} = 500 \ \mu A$ at $V_{OL} = 2 \ V$ (SEG1 to 32) |
| • 3-grid pre-driver outputs | : $I_{OH} = -5.0 \text{ mA}$ at $V_{OH} = V_{DISP} - 0.8 \text{ V}$ |
| (require external drivers) | $I_{OL} = 10 \text{ mA at } V_{OL} = 2 \text{ V}$ |
| • Logic outputs | : $I_{OH} = -200 \ \mu A$ at $V_{OH} = V_{DD} - 0.8 \ V$ |
| | $I_{OL} = 200 \ \mu A$ at $V_{OL} = 0.8 \ V$ |
| • Built-in digital dimming circuit (10-bit | resolution) |
| | |

- Built-in oscillation circuit (external R and C)
- Built-in Power-On-Reset circuit
- Package options:
- 56-pin plastic QFP (QFP56-P-910-0.65-2K)(ML9212GA)

BLOCK DIAGRAM

PIN CONFIGURATION (TOP VIEW)

PIN DESCRIPTIONS

| Symbol | Pin | Туре | Description |
|-------------------|------------------------------------|------|--|
| V _{DISP} | 43, 56 | _ | Power supply pins for VFD driver circuit. 43 pin and 56 pin should be connected externally. |
| V _{DD} | 14 | _ | Power supply pin for logic drive. |
| D-GND | 12, 49 | _ | D-GND is ground pin for the VFD driver circuit. L-GND is ground pin |
| L-GND | 21 | _ | for the logic circuit. 12 pin, 21 pin and 49 pin should be connected externally. |
| SEG1 to 22 | 30 to 42, 44 to 48, 50 to 53 | ο | Segment (anode) signal output pins for a VFD tube. These pins can be directly connected to the VFD tube. External circuit is not required. $I_{OHL} \leq -5$ mA |
| SEG23 to 32 | 1 to 8, 54, 55 | 0 | Segment (anode) signal output pins for a VFD tube. These pins can be directly connected to the VFD tube. External circuit is not required. $I_{OHL} \leq -10$ mA |
| GRID1 to 3 | 9, 10, 11 | ο | Inverted Grid signal output pins. For pre-driver, the external circuit is required. $I_{OL} \le 10 \text{ mA}$ |
| CS | 18 | I | Chip select input pin. Data is not transferred when CS is set to a Low level. |
| CLOCK | 19 | I | Shift clock input pin. Serial data shifts at the rising edge of the CLOCK. |
| DATA IN | 20 | I | Serial data input pin (positive logic). Data is input to the shift register at the rising edge of the CLOCK signal. |
| DUP/TRI | 24 | I | $\begin{array}{l} \mbox{Duplex/Triplex operation select input pin.} \\ \mbox{Duplex (1/2 duty) operation is selected when this pin is set to V_{DD}.} \\ \mbox{Triplex (1/3 duty) operation is selected when this pin is set to L-GND.} \end{array}$ |
| M/S | 25 | I | Master/Slave mode select input pin. Master mode is selected when this pin is set to V _{DD} . Slave mode is selected when this pin is set to L-GND. |
| DIM IN | 15 | I | Dimming pulse input. When the slave mode is selected, the pulse width of the all segment output are controlled by a input pulse width of DIM IN. Connect this pin to the master side DIM OUT pin at the slave mode. When the master mode is selected, the input level of this pin is ignored and the pulse width of the all grids and segment outputs are controlled by a built-in 10-bit dimming circuit. Connect this pin to V _{DD} or L-GND at the master mode. |

| Symbol | Pin | Туре | Description | | | | | | | | |
|------------------|----------|------|---|--|--|--|--|--|--|--|--|
| SYNC IN 1, 2 | 16, 17 | I | Synchronous signal input. When the slave mode is selected, connect these pins to the master side SYNC OUT 1, and 2 pins. When the master mode is selected, the input level of these pins are ignored. Connect these pins to V_{DD} or L-GND at the master mode. | | | | | | | | |
| DIM OUT | 28 | 0 | Dimming pulse output. Connect this pin to the slave side DIM IN pin. | | | | | | | | |
| SYNC OUT 1, 2 | 26, 27 | 0 | Synchronous signal output. Connect these pins to the slave side SYNC IN 1, and 2 pins. | | | | | | | | |
| OSC0 | 23 | I/O | RC oscillator connecting pins. Oscillation frequency depends on display tubes to be used. For details refer to ELECTRICAL CHARACTERISTICS. | | | | | | | | |
| NC | 13,22,29 | - | OPEN pins. | | | | | | | | |

ABSOLUTE MAXIMUM RATING

| Parameter | Symbol | Condition | Ratings | Unit |
|-----------------------|-------------------|----------------------------------|------------------------------|------|

FUNCTIONAL DESCRIPTION

Power-on Reset

When power is turned on, ML9212 is initialized by the internal power-on reset circuit. The status of the internal circuit after initialization is as follows:

- The status of the internal circuit after initialization is as follows
 The contents of the shift registers and latches are set to "0".
- The contents of the shift registers and fatches are set if
 The digital dimming duty cycle is set to "0".
- The digital dimming duty cycle is set to 0
 All segment outputs are set to Low level.
- All segment outputs are set to Low lev
- $\overline{\text{GRID1}}$ outputs are set to Low level.
- $\overline{\text{GRID2}}$ to $\overline{3}$ outputs are set to High level.

Data Transfer Method

Data can be transferred between the rising edge and the next falling edge of chip select input.

The mode data, segment data and dimming data are written by a serial transfer method. The serial data is input to the shift register at the rising edge of a shift clock pulse.

The mode data (M0 to M2) must be transferred after the segment data and dimming data succeedingly.

When the chip select input falls, an internal LOAD signal is automatically generated and data is loaded to the latches.

Function Mode

Function mode is selected by the mode data (M0 to M2). The relation between function mode and mode data is as follows:

| FUNCTION MODE | OPERATING MODE | FUNCTION DATA | | | | | |
|---------------|--------------------------------|---------------|----|----|--|--|--|
| FUNCTION MODE | OPERATING MODE | MO | M1 | M2 | | | |
| 0 | Segment Data for GRID1-3 Input | 0 | 0 | 0 | | | |
| 1 | Segment Data for GRID1 Input | 1 | 0 | 0 | | | |
| 2 | Segment Data for GRID2 Input | 0 | 1 | 0 | | | |
| 3 | Segment Data for GRID3 Input | 1 | 1 | 0 | | | |
| 4 | Digital Dimming Data Input | 0 | 0 | 1 | | | |

Segment Data Input [Function Mode: 0 to 3]

- ML9212 receives the segment data when function mode 0 to 3 are selected.
- The same segment data is transferred to the 3 segment data latches corresponding to $\overline{\text{GRID1}}$ to $\overline{3}$ at the same time when the function mode 0 is selected.
- The segment data is transferred to only one segment data latch corresponding to the specified GRID when the function mode is 1, 2 or 3 is selected.
- Segment output (SEG1 to 32) becomes High level (lightning) when the segment data (S1 to S32) is set to "1".

[Bit correspondence between segment output and segment data]

Digital Dimming Data Input [Function Mode: 4]

- ML9212 receives the digital dimming data when function mode 4 is selected.
- The output duty changes in the range of 0/1024 (0%) to 1016/1024 (99.2%) for each grid.
- The 10-bit digital dimming data is input from LSB.

Master Mode

Master Mode is selected when M/\overline{S} pin is set at High level. The master mode operation is as follows:

- \bullet The input levels of DIM IN, SYNC IN1 and SYNC IN2 are ignored, and these pins should be connected to L-GND or $V_{\text{DD}}.$
- The pulse width of $\overline{\text{GRID1}}$ to $\overline{3}$ and SEG1 to 32 are controlled by the internal digital dimming circuit.
- The segment Latch1 to 3 corresponding to $\overline{\text{GRID1}}$ to $\overline{3}$ are selected by the internal timing generator.

Slave Mode

Slave Mode is selected when M/\overline{S} pin is set at Low level. The slave mode operation is as follows:

- The internal dimming circuit is ignored.
- The pulse width of SEG1 to 32 are controlled by the pulse width of DIM IN signal.
- The segment Latch1 to 3 corresponding to $\overline{\text{GRID1}}$ to $\overline{3}$ are selected by SYNC IN1 and SYNC IN2 signals.
- The output levels of $\overline{\text{GRID1}}$ to $\overline{3}$ are set at High level. The output levels of DIM OUT, SYNC OUT1 and SYNC OUT2 are set at Low level.

APPLICATION CIRCUITS

1. Circuit for the duplex VFD tube with 128 segments (2 Grid × 64 Anode)

2. Circuit for the triplex VFD tube with 192 segments (3 Grid × 64 Anode)

NOTES ON TURNING POWER ON/OFF

- Connect L-GND and D-GND externally to be an equal potential voltage.
- To avoid wrong operations, turn on the driver power supply after turning on the logic power supply. Conversely, turn off the logic power supply after tuning off the driver power supply.
